Airfield pavements ,1973      Sustainable Concrete Solutions Costas Georgopoulos,Andrew Minson,2014-01-09 The challenges facing humanity in the 21st century include climate change population growth overconsumption of resources overproduction of waste and increasing energy demands For construction practitioners responding to these challenges means creating a built environment that provides accommodation and infrastructure with better whole life performance using lower volumes of primary materials less non renewable energy wasting less and causing fewer disturbances to the natural environment Concrete is ubiquitous in the built environment It is therefore essential that it is used in the most sustainable way so practitioners must become aware of the range of sustainable concrete solutions available for construction While sustainable development has been embedded into engineering curricula it can be difficult for students and academics to be fully aware of the innovations in sustainable construction that are developed by the industry Sustainable Concrete Solutions serves as an introduction to and an overview of the latest developments in sustainable concrete construction It provides useful guidance with further references to students researchers academics and practitioners of all construction disciplines who are faced with the challenge of designing specifying and constructing with concrete      **Proceedings of the ... Rétháti,2012-12-02 This is the first monograph to consider the possibility of utilizing probability theory in all essential fields of geotechnics It deals in detail with in situ and laboratory tests the evaluation of soil physical characteristics the preparatory phase and the individual problems of design including load bearing capacity prediction of settlements dimensioning of slopes and retaining walls and quality control of earthworks Numerous possibilities for and examples of the parallel utilization of deterministic and stochastic methods are given in the book creating a connection between conventional and new modern methodologies It demonstrates by examples that the only possibility of meeting technical and economic requirements simultaneously is by using the methods of probability theory The book also gives an account of new geotechnical and mathematical results of the author post evaluation of settlements and tilts plotting of statistical bore profiles elimination of the asymmetry of distribution by transformation etc The book enables practitioners and to acquire new modern design methods and research to develop methods It will also be useful for undergraduate and postgraduate training      **An Index of U.S. Voluntary Engineering Standards. **Evaluation of Long-term Field Performance of Cold In-place Recycled Roads** Don Chen,Charles Jahren,2007 Cold in place recycling CIR has become an attractive method for rehabilitating asphalt roads that have good subgrade support and

are suffering distress related to non structural aging and cracking of the pavement layer Although CIR is widely used its use could be expanded if its performance were more predictable Transportation officials have observed roads that were recycled under similar circumstances perform very differently for no clear reason Moreover a rational mix design has not yet been developed design assumptions regarding the structural support of the CIR layer remain empirical and conservative and there is no clear understanding of the cause effect relationships between the choices made during the design construction process and the resulting performance The objective of this project is to investigate these relationships especially concerning the age of the recycled pavement cumulative traffic volume support conditions aged engineering properties of the CIR materials and road performance Twenty four CIR asphalt roads constructed in Iowa from 1986 to 2004 were studied 18 were selected from a sample of roads studied in a previous research project HR 392 and 6 were selected from newer CIR projects constructed after 1999 This report describes the results of comprehensive field and laboratory testing for these CIR asphalt roads The results indicate that the modulus of the CIR layer and the air voids of the CIR asphalt binder were the most important factors affecting CIR pavement performance for high traffic roads For low traffic roads the wet indirect tensile strength significantly affected pavement performance The results of this research can help identify changes that should be made with regard to design material selection and construction in order to improve the performance and cost effectiveness of future recycled roads
