

Altering the Food Chain

IMPORTANCE OF THE FOOD CHAIN

Changing the Food Chain

When we change our ecosystems, we can sometimes cause unintended changes to food chains that can affect us in many different ways. In the basic example above, you can see that if we get rid of grasshoppers, the leaf population will grow drastically while the mice population will shrink. With less mice to hunt, the owl population will also shrink.

Altering the Food Chain – Real Life Example

In Borneo, DDT was used as a pesticide to kill mosquitoes that carried malaria. Malaria is a disease caused by a parasite that mosquitoes spread to people. Malaria can be deadly, but usually causes flu-like symptoms.

The problem with using DDT was that it didn't just kill the mosquito. It also killed all the other insects in the region it was used. This meant the cockroaches were killed, which were the main food for lizards. The number of lizards dropped dramatically, as well as the number of cats that ate the lizards. The cats kept the rat population under control. With less cats, the rat population grew tremendously.

The overpopulation of rats became a serious problem in Borneo. The rats ended up causing multiple epidemics that caused more deaths than malaria caused in the first place. To solve the problem of too many rats, the government of Borneo brought in thousands of cats from other countries. "Operation Cat Drop" was a success! With cats back in Borneo, they began to control the rat population.

Many lessons were learned from Borneo. Mainly that if you don't understand the inter-relationships between things, solutions often cause more problems.
