

EXAMPLE 11

- At first, assume a particular wheel that is not fixed.
- Observe how the diagram changes for the forces in the plane of the page for the case of an unrolling cylinder. (i.e., ignore the horizontal and vertical forces, ... forces from road and air pressure.)
- How does the free-body diagram change if the two wheels sufficiently close?
- Repeat the case of other forces in that case.

- Observe a quantity of a ball with the force. The ball is released from the ceiling and falls 0.2 m from an original position.
 - Observe the speed of the ball immediately after the drop.
 - As shown, the distance between the ball and the ground is 1.0 m. Observe the motion in the right-hand corner.
 - If the ball has a mass of 0.2 kg, and the distance from the point of suspension to the center of the ball is 1.2 m, determine the motion in the right-hand corner.

- Observe a ball of mass m in a vertical circle of radius R . The speed of the ball at the top of the circle is v_t , and the speed at the bottom of the circle is v_b . Show that the sum of the masses in the top and bottom of the circular motion is given by $\frac{m}{2}(v_t^2 + v_b^2)$.
