vibration of the ball can be predicted by an elastic sphere model given by $Fd Av$ Similar to sliding friction dynamic fracture is also a representative feature of solid dynamics with energy dissipation characteristics A crack tip in brittle materials propagates dynamically and exhibits crack branching or arresting according to the crack acceleration or deceleration This phenomenon is qualitatively in accord with stick slip friction This book investigates dynamic crack propagation using the method of caustics and a high speed camera First the stress intensity factor K_d for the dynamic case is evaluated and correlated with crack velocity and acceleration Second these parameters are correlated with the change in roughness of the fracture surfaces Crack branching is also studied to understand the energy dissipation Third the relationship between K_d and crack velocity is examined based on the unloading rate of the specimen during crack propagation Different specimen geometries and loading methods are used to clarify the effect of solid dynamics
