All four of the elements work on each band. Ten meters is a full-sized element using a trap formed with a small amount of linear loading (also used to shorten 20 meter section) and an air capacitor. Fifteen meters uses a tuned decoupling stub with another air capacitor and is also a full-size element. Twenty meters is approximately 75% of full size and defined by the element extending beyond the 15 meter decoupling jumper. Twenty and fifteen meters tune with total independence.

Power handling capability is excellent with no lossy coils or capacitors. Consequently efficiency is high (a conventional tribander may be rated at 8db gain but if it's only 50% efficient, the effective gain is really 5db).
