[Introduction to Modeling for Biosciences](#) David J. Barnes, Dominique Chu, 2010-07-23 Mathematical modeling can be a useful tool for researchers in the biological scientists Yet in biological modeling there is no one modeling technique that is suitable for all problems Instead different problems call for different approaches Furthermore it can be helpful to analyze the same system using a variety of approaches to be able to exploit the advantages and drawbacks of each In practice it is often unclear which modeling approaches will be most suitable for a particular biological question a problem which requires researchers to know a reasonable amount about a number of

techniques rather than become experts on a single one Introduction to Modeling for Biosciences addresses this issue by presenting a broad overview of the most important techniques used to model biological systems In addition to providing an introduction into the use of a wide range of software tools and modeling environments this helpful text reference describes the constraints and difficulties that each modeling technique presents in practice enabling the researcher to quickly determine which software package would be most useful for their particular problem Topics and features introduces a basic array of techniques to formulate models of biological systems and to solve them intersperses the text with exercises throughout the book includes practical introductions to the Maxima computer algebra system the PRISM model checker and the Repast Symphony agent modeling environment discusses agent based models stochastic modeling techniques differential equations and Gillespie s stochastic simulation algorithm contains appendices on Repast batch running rules of differentiation and integration Maxima and PRISM notation and some additional mathematical concepts supplies source code for many of the example models discussed at the associated website <http://www.cs.kent.ac.uk/imb> This unique and practical guide leads the novice modeler through realistic and concrete modeling projects highlighting and commenting on the process of abstracting the real system into a model Students and active researchers in the biosciences will also benefit from the discussions of the high quality tried and tested modeling tools described in the book Dr David J Barnes is a lecturer in computer science at the University of Kent UK with a strong background in the teaching of programming Dr Dominique Chu is a lecturer in computer science at the University of Kent UK He is an internationally recognized expert in agent based modeling and has also in depth research experience in stochastic and differential equation based modeling
