Glovebox Pressure Relief and Check Valve ,1986 This device is a combined pressure relief valve and check valve providing overpressure protection and preventing back flow into an inert atmosphere enclosure The pressure relief is embodied by a submerged vent line in a mercury reservoir the relief pressure being a function of the submerged depth The pressure relief can be vented into an exhaust system and the relieving pressure is only slightly influenced by the varying pressure in the exhaust system The check valve is embodied by a ball which floats on the mercury column and contacts a seat whenever vacuum exists within the glovebox enclosure Alternatively the check valve is embodied by a vertical column of mercury the maximum back pressure being a function of the height of the column of mercury Pressure Testing Probe and

Shannon,GENERAL DYNAMICS/ASTRONAUTICS SAN DIEGO CA.,1960 During tanking and pre countdown procedure at the 1 4 Test Stand a booster main fuel valve opened flooding the chamber with fuel and necessitating an abort of the count down Among the events leading up to this the igniter purge lines were pressurized to clear moisture out of the hypergol case preparatory to inserting the hypergol cartridge The fuel valve opened when the purge pressure reached approximately 200 psig The objective of the test is to duplicate the conditions that could have existed at 1 4 Stand and observe the results and to evaluate the safety capabilities of the relief action of the igniter valves Author **Directions for Testing and Maintaining Existing Double Check Valve**

Jewsbury,1977 Patent Double Self-Acting Gas Check Valve ,2017 Fuel Level Control Valves/Systems AE-5A Aerospace Fuel, Inerting and Lubrication Sys Committee,2007 A fuel level control valve system controls the quantity of fuel in a tank being filled or emptied This document provides a general familiarization with these mechanisms e g forms they take functions system design considerations This document provides the aircraft fuel system designer with information about these mechanisms devices so that he can prescribe the types of level control valves systems which are best suited for his particular fuel system configuration *Fault Diagnosis of Electronic Fuel Control (EFC) Valves Via Dynamic Performance Test Method* Umut Tugsal,2009 Electronic Fuel Control EFC valve regulates fuel flow to the injector fuel supply line in the Cummins Pressure Time PT fuel system The EFC system controls the fuel flow by means of a variable orifice that is electrically actuated The supplier of the EFC valves inspects all parts before they are sent out Their inspection test results provide a characteristic curve which shows the relationship between pressure and current provided to the EFC valve This curve documents the steady state characteristics of the valve but does not adequately capture its dynamic response A dynamic test procedure is developed in order to evaluate the performance of the EFC valves The test itself helps to understand the effects that proposed design changes will have on the stability of the overall engine system A by product of this test is the ability to evaluate returned EFC valves that have experienced stability issues The test determines whether an EFC valve is faulted or not before it goes out to prime time use The characteristics of a good valve

and bad valve can be observed after the dynamic test In this thesis a mathematical model has been combined with experimental research to investigate and understand the behavior of the characteristics of different types of EFC valves The model takes into account the dynamics of the electrical and mechanical portions of the EFC valves System Identification has been addressed to determine the transfer functions of the different types of EFC valves that were experimented Methods have been used both in frequency domain as well as time domain Also based on the characteristic patterns exhibited by the EFC valves fuzzy logic has been implemented for the use of pattern classification **ASME 65-PET-22** Joe R.
