Karam, 2024-12-03 This book discusses the environmental hazards in the Gulf countries GCC The publication of this book is of great importance to all those interested and knowledgeable in the field Climate change leads to the occurrence of major environmental hazards that must be reduced by estimating the extent of climate change and developing appropriate solutions to mitigate those effects Climate changes are produced indirectly as a result of human activities with uncalculated consequences The process of climate change is always accompanied by catastrophic environmental problems such as global warming high temperatures storms hurricanes floods desertification processes air pollution and the extinction of many types and forms of animals and plants The Gulf countries are located in the eastern part of the Arabian Peninsula where the crude oil is extracted in several fields The states suffer from many environmental problems as a result of its geographical location global climate change and also from oil extraction operations The problems include high temperatures induced earthquakes and pollution in the soil and marine coast as well as desertification processes sand dunes movement and other environmental problems Earthquakes are also recorded from and near the oil fields indicating the link between the oil extraction process and the occurrence of earthquakes Indeed the environmental studies published in the Gulf state are very few and do not meet the need of the scientific community in region which need more important environmental publications that help in the great and rapid urban developments in the area **Design of precast concrete structures against accidental actions** fib Fédération

internationale du béton, 2012-01-01 Since the 1980 s several buildings throughout the world have been subject to gas explosions impact by cars or airplanes or car bomb attacks In many cases the effect of the impact or explosion has been the failure of a critical structural member at the perimeter of the building After the failure the load supported by that member could not be redistributed and part or all of the structure has collapsed in a progressive manner The phenomenon that occurs when local failure is not confined to the area of initial distress and spreads horizontally and or vertically through the structure is termed progressive collapse Progressive collapse is a relatively rare event as it requires both an accidental action to cause local damage and a structure that lacks adequate continuity ductility and redundancy to prevent the spread of damage It is technically very difficult and economically prohibitive to design buildings for absolute safety However it is possible to construct precast concrete buildings that afford an acceptable degree of safety with regard to accidental actions A structure is normally designed to respond properly without damage under normal load conditions but local and or global damages cannot be avoided under the effect of an unexpected but moderate degree of accidental overload Properly designed and constructed structures usually possess reasonable probability not to collapse catastrophically under such loads

depending on different factors for example the type of loading the degree and the location of accidental loading in regard to the structure and its structural members the type of structural system the construction technology and the spans between structural vertical members etc No structure can be expected to be totally resistant to actions arising from an unexpected and extreme cause but it should not be damaged to an extent that is disproportionate to the original cause The aim of fib Bulletin 63 is to summarize the present knowledge on the subject and to provide guidance for the design of precast structures against progressive collapse This is addressed in terms of a the classification of the actions b their effect on the structural types c the strategies to cope with such actions d the design methods and e some typical detailing all supplemented with illustrations from around the world and some model calculations **Wind and Seismic Effects** United States-Japan Cooperative Program in Natural Resources. Structural Design Guide to the ACI Building Code Edward S. Hoffman, David P. Gustafson, Albert J. Gouwens, 2013-03-09 This book is intended to guide practicing structural engineers familiar with earlier ACI building codes into more profitable routine designs with the ACI 1995 Building Code ACI 318 95 Each new ACI Building Code expresses the latest knowledge of reinforced concrete in legal language for safe design application Beginning in 1956 with the introduction of ultimate strength design each new code offered better utilization of high strength reinforcement and the compressive strength of the concrete itself Each new code thus permitted more economy as to construction material but achieved it through more detailed and complicated design calculations In addition to competition requiring independent structural engineers to follow the latest code for economy it created a professional obligation to follow the latest code for accepted levels of structural safety The increasing complexity of codes has encouraged the use of computers for design and has stimulated the development of computer based handbooks Before computer software can be successfully used in the
