

Human Reproduction

Human reproduction

Human reproduction is sexual reproduction involving male and female reproductive cells called gametes. The reproductive system includes organs called gonads that produce gametes and hormones; ducts for transport, storage and composition of gametes; accessory organs and glands for fluid secretion; and internal genitalia. Reproduction is regulated by hormones produced by the gonads, the hypothalamus and the pituitary gland. Fertilisation involves the introduction of sperm into the vagina. The sperm travels through the female reproductive tract until it encounters an ovum, a female sex gamete. Fertilisation can then take place.

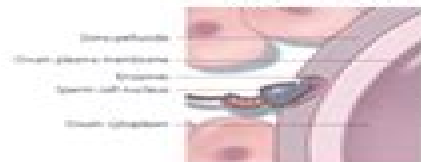

Male reproductive system

The adult male reproductive system is a complex of two primary external structures, the testes and the penis. The testes are divided into thousands of tiny compartments or lobules containing seminiferous tubules, tightly coiled structures where sperm formation takes place.

The testes are situated in a scrotum, a skin structure called the scrotum, which provides support and regulates the position of the testes relative to the body. The scrotum moves because of the testes' need to change its external temperature to maintain the proper temperature within the testes for sperm formation.

Seminiferous tubules produce sperm cells, which are transported to the epididymis, a structure in the scrotum responsible for maturing the sperm and for the transport of the sperm into the penis and for the development of male secondary sex characteristics.

Fertilization

The upper portion of the vagina leads to the vaginal canal for fertilisation. Millions of sperm travel through the female reproductive tract, following the path of the egg. When a sperm enters the vagina, it follows the path of the egg. The sperm travels through the vagina, the cervix, the uterus, and the fallopian tube, where it meets the egg. The sperm enters the egg, and the egg's nucleus and cytoplasm combine with the sperm's nucleus and cytoplasm to form a zygote. The zygote then develops into an embryo.

Female reproductive system

The internal structure of the adult female reproductive system includes the vagina, uterus, ovaries and fallopian tubes. These structures form a pathway allowing the release of an egg cell, fertilisation, its growth and delivery of a developed fetus. The vagina is a muscular canal that leads from the uterus to the outside of the body. It is the lower part of the uterus. It channels through the cervix allows the passage of sperm and menstrual discharge. The uterus is a hollow pear-shaped organ with muscular walls that contract during childbirth. The lower part of the uterus is the cervix, which opens into the vagina. The fallopian tubes, which connect the uterus to the ovaries, are responsible for transporting the egg from the ovary to the uterus. The fallopian tubes are also responsible for fertilisation.

The ovaries, located on each side of the uterus, are responsible for producing eggs as well as the female sex hormones estrogen and progesterone. Estrogen is responsible for the development of the female reproductive system, sexual characteristics, and breast development. Progesterone prepares the uterus lining for implantation of a fertilized egg and is necessary for breast milk production. The ovaries are connected to the uterus by the fallopian tubes, which provide a pathway for the egg to reach the uterus.

Ovulation & the menstrual cycle

The menstrual cycle refers to the sequence of events that occurs in the endometrium, the lining of the uterus. The cycle normally lasts approximately 28 days. The purpose is to prepare the uterus for possible pregnancy. The menstrual cycle is governed by the endocrine system. It involves the release of eggs from the ovaries and the shedding of the uterine lining. The cycle is regulated by hormones from the hypothalamus and the pituitary gland.
