**Crystallization of Polymers: Volume 1, Equilibrium Concepts** Leo Mandelkern, 2002-09-19 First published in 2002 from an original 1964 edition in the Crystallization of Polymers 2nd edition Leo Mandelkern provides a self contained treatment of polymer crystallization All classes of macromolecules are included and the approach is through the basic disciplines of chemistry and physics The book discusses the thermodynamics and physical properties that accompany the morphological and structural changes that occur when a collection of molecules of very high molecular weight are transformed from one state to another Volume 1 is a presentation of the equilibrium concepts that serve as a basis for the subsequent volumes In this volume the author shows that knowledge of the equilibrium requirements is vital to understanding all aspects of the polymer crystallization process and the final state that eventually evolves This book will be an invaluable reference work for all chemists physicists and materials scientists who work in the area of polymer crystallization

**Physico-Chemical Properties of Selected Anionic, Cationic and Nonionic Surfactants** N.M. van Os, J.R. Haak, L.A.M. Rupert, 2012-12-02 The number of physico chemical investigations of surfactants in solution whether aqueous or nonaqueous has dramatically increased in recent years However literature reports on surfactants in solutions are scattered over a plethora of scientific journals and books which differ widely in scope and readership Such data are often difficult to retrieve because there have been no systematic compilations with the exception of those for CMCs and for micelle aggregation numbers The present compilation meets that need by covering as completely as possible the physico chemical properties of selected series of homologous surfactants These surfactants are in most cases isomerically pure are well known and have been used in numerous academic and industrial studies The properties include aggregation number cloud point CMC <sup>13</sup>C NMR correlation length counterion binding density enthalpy of micelle formation entropy of micelle formation Gibbs free energy of micelle formation head group area <sup>1</sup>H NMR hydration number Krafft temperature melting point micelle radius microscopic viscosity miscibility curve partial molar volume phase inversion temperature refractive index self diffusion coefficient surface tension and upper critical temperature The book also contains two and three component phase diagrams of many nonionic surfactants The solvent is water in most cases however some data refer to properties in D<sub>2</sub>O electrolyte solutions and nonaqueous solvents The variables are temperature and concentration Where possible the method of measurement is given Data on the purity of the compounds and the accuracy of the measurement methods are not included as these can easily be found in the original sources which mostly date from the period 1970 1991 and are given at the end of each chapter The Index section contains a compound index a property index a symbol index and a cross index which facilitate easy access to the data This valuable collection of data will be of great use to anyone involved in Colloid and Surface Science academics as well as industrial
