problems have been solved outstanding Lorentzian spaces and groups have been classified new applications to mathematical
relativity and high energy physics have been found and further connections with other geometries have been developed
Samples of these fresh trends are presented in this volume based on contributions from the VI International Meeting on
Lorentzian Geometry held at the University of Granada Spain in September 2011 Topics such as geodesics maximal trapped
and constant mean curvature submanifolds classifications of manifolds with relevant symmetries relations between
Lorentzian and Finslerian geometries and applications to mathematical physics are included This book will be suitable for a

Orbiting The Moons Of Pluto: Complex Solutions To The Einstein, Maxwell, Schrodinger And Dirac Equations Richard L Amoroso, Elizabeth A Rauscher, 2011-03-21 The Maxwell Einstein Schrödinger and Dirac equations are considered the most important equations in all of physics This volume aims to provide new eight and twelve dimensional complex solutions to these equations for the first time in order to reveal their richness and continued importance for advancing fundamental Physics If M Theory is to keep its promise of defining the ultimate structure of matter and spacetime it is only through the topological configurations of additional dimensionality or degrees of freedom that this will be possible Stretching the exploration of complex space through all of the main equations of Physics should help tighten the noose on the fundamental theory This kind of exploration of higher dimensional spacetime has for the most part been neglected by M theorists and physicists in general and is taken to its penultimate form here
