Henry,2021-06-30 The global population is projected to reach almost 10 billion by 2050 and food and feed production will need to increase by 70% Wheat

maize and sorghum are three key cereals which provide nutrition for the majority of the world's population. Their production is affected by various abiotic stresses which cause significant yield losses. The effects of climate change also increase the frequency and severity of such abiotic stresses. Molecular breeding technologies offer real hope for improving crop yields. Although significant progress has been made over the last few years, there is still a need to bridge the large gap between yields in the most favorable and most stressful conditions. **Cereal Grain Quality** R. Henry, P. Kettlewell, 2012-12-06

Cereals range from human food and beverages to animal feeds and industrial products. It is human food and beverages which are the predominant uses covered in this book since the nutritional quality of cereals for animal feed is described in other publications on animal nutrition and industrial products are a relatively minor use of cereals. Cereals are the main components of human diets and are crucial to human survival. Three species: wheat, rice, and maize account for the bulk of human food. Barley is the major raw material for beer production and ranks fourth in world production. Other species such as sorghum are regionally important. This book covers all the major cereal species: wheat, rice, maize, barley, sorghum, millet, oats, rye, and triticale. Specific chapters have been devoted to a description of the major end uses of each of the species and to definition of the qualities required for each of their end uses. The functional and nutritional quality of cereals determines their suitability for specific purposes and may limit the quality of the end product, influencing greatly the commercial value of grain. An understanding of the factors that determine grain quality is thus important in the maintenance of efficient and sustainable agricultural and food production. The biochemical constituents of the grain that determine quality have been described in chapters on proteins, carbohydrates, and other components. An understanding of the relationships between grain composition and quality is important in selecting grain for specific uses. *Scientific and Technical Aerospace Reports*, 1982
