**Diversification** J. Halla, M.J. Whitehouse, T. Ahmad, Z. Bagai, 2017-03-01 This Special Publication sheds light on crust formation and tectonic processes in early Earth by focusing on Archaean granitoids and related rocks from West Greenland in the North Atlantic Craton Karelia Province of the Fennoscandian Shield Eastern Dharwar and Bundelkhand cratons in the Indian Shield and Bug Complex of the Ukrainian Shield Resulting from the IGCP SIDA 599 project The Changing Early Earth this compilation of papers provides explanations on the nomenclature of Archaean granitoids and explores the petrology element and isotope geochemistry geochronology and metamorphism of granitoids and supracrustal rocks of variable metamorphic grade This volume provides information on the increase and timing of crust mantle interactions and granitoid diversification from early Archaean protoliths of island arc origin to the emergence of multi source high K calc alkaline granitoid batholiths at convergent continental margins The formation of abundant granitoid batholiths suggests a significant change in mantle dynamics and plate tectonics towards the end of the Archaean      **Oceanic and Continental Lithosphere**

Valérie Chavagnac, 1999 The aims of this Ph D Thesis were to decipher whether the use of Nd model ages are reliable constraints for the crustal evolution on Proterozoic migmatized terrane example of the Limpopo Belt in South Africa and to examine the consistency between Sm Nd garnet and V Pb zircon ages on eclogites example of the VHPM Dabieshan in Central China The Central Zone of the Limpopo Belt which is mainly composed of orthogneisses and paragneisses underwent granulite facies metamorphism followed by decompression metamorphic conditions clockwise P T loop at 2.0 Ga We have performed Sm Nd and U Pb work associated with major and trace element analyses on three examples of migmatites generated at 2.0 Ga to study the chemical and isotopic fractionation which may occur during migmatization Partial melting following the Bt dehydration reaction did lead to different behaviour of Sm Nd systematics for metagreywacke and

metapelite In the first case chemical equilibrium and full Nd isotope exchanges were not reached due to the incongruent Pl melting and to the effect of accessory minerals Mnz and Ap on the compositions of the partial melt Monazite entered the melt in preference to apatite either by dissolution or by entrainment and its unradiogenic Nd isotope signature dominates the leucosome The Nd model ages on partial melt are up to 400 Ma older than those on paleosomes The Nd model ages of these rocks cannot be used in a simple way to constrain the evolution of Southern Africa In the second case incongruent Pl melting influenced the distribution of major LILE and also REE between the partial melts and the paleosomes Full Nd isotope exchange was nearly achieved while Pb-Pb systematics were not fully reset Incomplete exchange for both Nd and Pb for two leucosomes is also argued It appears that the accessory minerals were chemically and isotopically equilibrated with the partial melt and the paleosome The Nd model ages can be used to constrain the crustal growth of the Limpopo Central Zone Finally in migmatites formed by metamorphic segregation at subsolidus conditions on orthogneiss chemical equilibrium and Nd isotope exchange were not reached during migmatization The distributions of the elements are related to the proportional amounts of each mineral in the migmatitic components However full Pb isotope exchange is reached here as highlighted by a Pb-Pb WR isochron yielding 2.0 Ga In addition the geochemical characteristics combined with REE modelling provided arguments for closed system behaviour of the whole rock during migmatization The isotopic compositions of the protolith obtained via mass balance calculations can be used to constrain crustal evolution The UHPM Dabieshan is characterized by the occurrence of coesite and its quartz pseudomorph as inclusions in eclogites of basaltic composition but also of undoubted metasedimentary origin Sm-Nd garnet omphacite whole rock isochrons on the coesite bearing eclogites of the Bixiling Complex gave ages at 210.9 to 218.4 Ma which are similar to 218.4 ± 1.8 Ma and 218.4 ± 2.5 Ma ages obtained by V-Pb zircon data At the Shuanghe locality Sm-Nd garnet kyanite whole rock isochron on a retrogressed eclogite gave an age at 231.35 Ma in line with the U-Pb zircon data at 233.21 Ma lower intercept in the concordia diagram In addition Ar-Ar and Rb-Sr phengite ages performed on the eclogite host gneisses Bixiling locality yield 198.4 Ma to 212.2 Ma ages overlapping the previous Sm-Nd and V-Pb zircon ages on the coesite bearing eclogites Consequently the Sm-Nd garnet dating provide ages in agreement with V-Pb zircon ages and the quartz-feldspathic gneisses underwent an event coeval to VHP on eclogites Nd isotope equilibration at the VHP metamorphism appears to have been complete
