vertebrate there is no form better adapted than the common frog To be sure the frog is not so generalized in structure as the more primitive urodele but this slight disadvantage is offset by the greater ease with which frogs may be obtained in large numbers and the better development of the hind limbs is favorable for the study of muscles Since the more specialized structures of the frog are mainly concerned with its mode of locomotion these adaptations do not markedly affect the internal organs other than the skeleton and the muscles In order that the student may realize in what respects the frog is modified from the primitive tetrapod type comparison of the form and orientation of the body should be made with the more typical caudata for this purpose articulated skeletons as well as entire specimens should be used About the Publisher Forgotten Books publishes hundreds of thousands of rare and classic books Find more at [www.forgottenbooks.com](http://www.forgottenbooks.com) This book is a reproduction of an important historical work Forgotten Books uses state of the art technology to digitally reconstruct the work preserving the original format whilst repairing imperfections present in the aged copy In rare cases an imperfection in the original such as a blemish or missing page may be replicated in our edition We do however repair the vast majority of imperfections successfully any imperfections that remain are intentionally left to preserve the state of such historical works
