

3. During normal operation

When the throttle valve is opened, vacuum arises at the adapter venturi nozzle, which is applied to chamber C through the main path. This vacuum pulls second diaphragm to open elastic face valve 2. As a result, LPG flows from chamber B to chamber C, and enters the adapter venturi nozzle through the main path.

As a current also flows in the slow solenoid valve, LPG also flows from chamber B to chamber D, and through the slow path to the venturi nozzle, and is also supplied to the engine by the LPG injector through the injector path.

While the engine is running in medium load range, LPG fuel is mostly supplied through the main path, and LPG injector injects the shortage amount of fuel to the ideal air-fuel ratio.

While the engine is in high load range, the FCM at adapter changes the amount of fuel flow to adjust the overall fuel amount, on the other hand, the injector supplies a fixed amount of fuel with engine.
