Ignition System Electrical Circuit

The secondary circuit consists of the:

- Secondary windings of the ignition coil
- High tension wires
- Distributor rotor and cap
- Spark plugs

With the key-starter switch in the "start" position and the distributor contact points closed, the current in the

primary circuit flows from the battery, through the tension wires, through the ignition coil primary winds through the distributor contact points, and back to battery through ground.

The flow of current through the primary winds creates a strong magnetic field within the ignition. When the contact points begin to open, the primary circuit is broken and the low voltage current flows in the condenser. The condenser stops the flow of primary current suddenly, resulting in a quick collapse of the magnetic field around the coil primary winds. This action induces a high (secondary) voltage in secondary windings of the coil. The high voltage can

the required current from the coil, through a high tension wire, to the distributor center terminal. From the center terminal, the high voltage is transmitted by the distributor rotor to the correct spark plug wire contained in the distributor cap, to the spark plug high tension wire, and into the spark plug. The current passes through the spark plug and across the spark plug gap where a spark occurs, resulting in the ignition of the fuel-air mixture in the combustion chamber.

The spark timing is regulated by centrifugal and vacuum spark advance mechanisms. The centrifugal
