

Mitosis

How does sexual reproduction lead to genetic variation?

Why?

Cells reproduce through mitosis to make exact copies of the original cell. This is done for growth, and repair. Sexually reproducing organisms have a sexual form of cell division that produces reproductive cells with half the number of chromosomes. This process is called **meiosis**, and without it, humans, oak trees, lilies, and all other sexually reproducing organisms would be exactly identical to their ancestors.

Model 1 - Meiosis I

1. According to Model 1, in what type of organisms are the cells that create gametes?

Cells from the sex organs.

Electrostatic Considerations in Mitosis L. John Gagliardi, 2009

Identifying the motive force is central to explaining chromosome motions during mitosis Presently there is no consensus on what it is The author has proposed a minimal assumptions model for the dynamics of post attachment chromosome motions based on nanoscale electrostatics Given the electrical properties of tubulin and the dynamic instability of microtubules it is possible to account for prometaphase post attachment metaphase and anaphase chromosome motions within a comprehensive model The model addresses all of the following in a unified manner Efficiency of aster and spindle assembly and the motive force for the motion of asters and forming half spindles Chromatid pair attachment Motion of monovalently attached chromatid pairs Motion of bivalently attached chromatid pairs and chromosome congression Metaphase chromatid pair oscillations Chromatid separation and anaphase A chromosome motion Anaphase B pole separation An ab initio calculation of the maximum tension force exerted by a microtubule during mitosis that falls within the experimental range Poleward force generation of chromosomes at poles with associated microtubule flux
