This system is designed to capture the essential (200–2000 Å) covered range, the one intended to capture the really big bang optical emission lines. The multi-channel diffracting the light into a few channels in long gratings. They will channel the coverage on Å scale but it is believed that the full covered 10 Å can be further compressed by a dichroic mirror. When the system is ready to be developed, the authors will publish a preliminary study on the technique for the full wavelength coverage. To facilitate the efforts of other researchers using this system, we have made a short list of available filters.
