The missing woodland resources Marian Berihuete-Azorín, María Martín Seijo, Oriol López-Bultó, Raquel Piqué, 2022-07-20 Woodlands are a key source of raw materials for many purposes since early Prehistory. Wood bark, resin, leaves, fibres, fungi, moss or tubers have been gathered to fulfill almost every human need. That led societies to develop specific technologies to acquire, manage, transform, elaborate, use and consume these resources. The materials provided by woodlands covered a wide range of necessities such as food, shelter, clothing or tool production, but they also provided resources employed for waterproofing, dyeing, medicine and adhesives among many others. All these technological processes and uses are commonly difficult to identify through the archaeological record. Some materials are exclusively preserved by charring or in anaerobic conditions at very exceptional sites or leave only a very slight trace behind them, e.g. containers. Consequently, they have received far less attention in archaeobotanical studies compared to other kind of plant materials consumed as food or firewood. This book provides an overview of technological uses of plants from the Palaeolithic to the Post Medieval period. This collection of papers presents different archaeobotanical and archaeological studies dealing with the use of a wide range of woodland resources, most of them among the less visible for archaeology such as bast fibres and fungi. These papers present different approaches for their study, combining archaeology, archaeobotany and ethnoarchaeology.

Ongoing Research in Jawed Fish Immunity: Structural and Functional Studies at the Protein and Cellular Levels Monica Imarai, Brian Dixon, 2020-06-04 Knowledge of jawed fish immune systems obtained in the last 15 years has been mostly obtained through the sequencing of genomes of different fish species and from the use of high throughput techniques such as transcriptomic analysis and RNA sequencing, which has allowed characterization of immune gene responses at the transcriptomic level. Although these have been important tools for exploring the complexities of the immune responses of fish species, the next generation of knowledge requires the use of new tools and methods capable of unveiling the diversity of immune cells and molecules in jawed fish, the network of interactions and responses and the mechanisms leading to immune protection against pathogens. For more than 10 years, many laboratories have been engaged in developing antibodies against key molecules of jawed fish immune systems in several different species because the lack of sequence conservation of most immune genes makes it impossible to use the large panel of antibodies against mammalian molecules for recognition of fish molecules. The numerous genes encoding cytokines and receptors have now been used to make recombinant proteins available, allowing studies of the complex network of cytokine and receptor functions central to fish immune responses. From many laboratories, new and interesting knowledge about immune cells, their functions and interactions can be studied with the availability of new tools and methods. We have begun to provide a clear understanding of fish immunity at the protein and cellular levels. This Research Topic gives a comprehensive overview of the current knowledge of jawed fish immune responses with a particular emphasis on structural and functional studies at the protein and cellular levels.

In-situ Small-Angle X-ray Scattering Investigation of

Transient Nanostructure of Multi-phase Polymer Materials Under Mechanical Deformation Ahmad

Zeinolebadi, 2013-01-30 The results in this dissertation set the ground to answer a fundamental question in data driven polymer material science Why don't prepared composites show less fatigue than the pure plastics A simultaneous analysis of mechanical testing and small angle X Ray scattering from the DESY source in Hamburg has been applied to approach this question which is also central to the European research project Nanotough and the results are clearly presented in this book The evolution of the materials structure is visualized and quantitatively analyzed from exhaustive sequences of scattering images Three different classes of polymer composites are presented as typical and illustrative examples The obtained results illustrate that the interactions of their components can cause unpredictable structural effects ultimately leading to a weakening of the material where a reinforcement was expected
