

- **Freeboard**
The freeboard (see Figure 8.14) defines a critical water level (Invert level- Freeboard) at the connection node in the pipe network below which the defined DQ relation apply. For submerged and reverse flow (surcharge), the transfer capacity of the connection reverts to a standard orifice relationship.

Figure 8.14 Freeboard detail in a Curb Inlet

The freeboard describes the distance (depth) from the Grade Invert Level to the Critical Water Level (i.e. $\text{Freeboard} = \text{Grade Invert Level} - \text{Critical Water Level}$). The Critical Water Level is the level above which the basin is considered to be 'drowned' such that the DQ relationship for transferring water from the surface to the node no longer applies. For submerged and reverse flow conditions the exchange of water across the coupling reverts to a standard orifice equation.

Point Cloud Data Fusion for Enhancing 2D Urban Flood Modelling
Vorawit Meesuk, 2017-07-20 Modelling urban flood dynamics requires proper handling of a number of complex urban features Although high resolution topographic data can nowadays be obtained from aerial LiDAR surveys such top view LiDAR data still have difficulties to represent some key components of urban features Incorrectly representing features like underpasses through buildings or apparent blockage of flow by sky trains may lead to misrepresentation of actual flood propagation which could easily result in inadequate flood protection measures Hence proper handling of urban features plays

an important role in enhancing urban flood modelling This research explores present day capabilities of using computer based environments to merge side view Structure from Motion data acquisition with top view LiDAR data to create a novel multi source views MSV topographic representation for enhancing 2D model schematizations A new MSV topographic data environment was explored for the city of Delft and compared with the conventional top view LiDAR approach Based on the experience gained the effects of different topographic descriptions were explored for 2D urban flood models of i Kuala Lumpur Malaysia for the 2003 flood event and ii Ayutthaya Thailand for the 2011 flood event It was observed that adopting the new MSV data as the basis for describing the urban topography the numerical simulations provide a more realistic representation of complex urban flood dynamics thus enhancing conventional approaches and revealing specific features like flood watermarks identification and helping to develop improved flood protection measures
