Burgess,2011 **Configuration for Wireless Network Based on Hotspot and CAPsMAN** Maya Sari,Azriel Christian Nurcahyo,2024-08-02 In the present scenario a growing need is stressed on having wireless networks both indoors and outdoors of diverse large environments like public areas corporate offices and government sectors schools and colleges Traditional network deployments on the other hand generally rely on either bridging or rather on the full CSS deployment method while often making use of NAT on every access point This causes interference with access points operating beyond the DHCP server lease limits with frequent loop issues arising within the wireless infrastructures Thus network administrators face the challenge of adding many simultaneous access points that do not have the ability to be integrated thus giving rise to numerous challenges in meeting demand with reliable networking solutions that provide quick distribution of vouchers or enable user registrations per ID especially during peak usage periods involving large numbers of users who are connected concurrently **Data Science Techniques for Beginner Network Administrators** Yulius Yus,Azriel

Christian Nurcahyo,Heni Ermewaningsih,2024-08-12 There is an old saying It is easier to wake someone who is sound asleep than to wake who is pretending to sleep As network administrators competing with AI systems in the future is not an impossibility Analyzing events with simple examples like comparing bandwidth throughput jitter and optimizing server resource usage can be exhausting when applied to dozens or hundreds of devices For instance how do we classify when the bandwidth is low in one place but normal elsewhere based on several sample events Or how do we classify which servers need maintenance and which do not based on existing data parameters referring to unsupervised and supervised learning Classification models can indeed simplify and optimize our work saving time compared to performing network maintenance one by one using only Google Colab In this context we have tried using a small of unsupervised and supervised learning to process data from simple network case studies These data are analyzed for classification regression and prediction using Python scripts implemented in Google Colab This book serves as a starting point to be developed into a continuous series extending to supervised learning deep learning and reinforcement learning which are still in the testing and writing phase We hope this new approach benefits network administrators wherever you are
