Commercial Gazette ,1891 Mining Massive Data Sets for Security Françoise Fogelman-Soulié,2008 The real power for
 security applications will come from the synergy of academic and commercial research focusing on the specific issue of
 security Special constraints apply to this domain which are not always taken into consideration by academic research but are
 critical for successful security applications large volumes techniques must be able to handle huge amounts of data and
 perform on line computation scalability algorithms must have processing times that scale well with ever growing volumes
 automation the analysis process must be automated so that information extraction can run on its own ease of use everyday
 citizens should be able to extract and assess the necessary information and robustness systems must be able to cope with
 data of poor quality missing or erroneous data The NATO Advanced Study Institute ASI on Mining Massive Data Sets for
 Security held in Italy September 2007 brought together around ninety participants to discuss these issues This publication
 includes the most important contributions but can of course not entirely reflect the lively interactions which allowed the
 participants to exchange their views and share their experience The bridge between academic methods and industrial
 constraints is systematically discussed throughout This volume will thus serve as a reference book for anyone interested in
 understanding the techniques for handling very large data sets and how to apply them in conjunction for solving security

issues *Semantic Mining of Social Networks* Jie Tang, Juanzi Li, 2022-06-01 Online social networks have already become a bridge connecting our physical daily life with the web based information space This connection produces a huge volume of data not only about the information itself but also about user behavior The ubiquity of the social Web and the wealth of social data offer us unprecedented opportunities for studying the interaction patterns among users so as to understand the dynamic mechanisms underlying different networks something that was previously difficult to explore due to the lack of available data In this book we present the architecture of the research for social network mining from a microscopic point of view We focus on investigating several key issues in social networks Specifically we begin with analytics of social interactions between users The first kinds of questions we try to answer are What are the fundamental factors that form the different categories of social ties How have reciprocal relationships been developed from parasocial relationships How do connected users further form groups Another theme addressed in this book is the study of social influence Social influence occurs when one s opinions emotions or behaviors are affected by others intentionally or unintentionally Considerable research has been conducted to verify the existence of social influence in various networks However few literature studies address how to quantify the strength of influence between users from different aspects In Chapter 4 and in 138 we have studied how to model and predict user behaviors One fundamental problem is distinguishing the effects of different social factors such as social influence homophily and individual s characteristics We introduce a probabilistic model to address this problem Finally we use an academic social network ArnetMiner as an example to demonstrate how we apply the introduced technologies for mining real social networks In this system we try to mine knowledge from both the informative publication network and the social collaboration network and to understand the interaction mechanisms between the two networks The system has been in operation since 2006 and has already attracted millions of users from more than 220 countries regions
