Solve these genetics problems. Be sure to complete the Punnett square to show how you derived your solution.

1. In humans the allele for albinism is recessive to the allele for normal skin pigmentation. If two heterozygotes have children, what is the chance that a child will have normal skin pigment? What is the chance that a child will be albino?

	A	a	normal pigment:
A	AA	Aa	75% chance of AA & Aa
a	Aa	aa	albino: 25% chance of aa

- a. If the child is normal, what is the chance that it is a carrier (heterozygous) for the albino allele? (**CAREFUL**) 2/3 or 67%
2. In purple people eaters, one-horn is dominant and no horns is recessive. Show the cross of a purple people eater that is heterozygous for horns with a purple people eater that does not have horns. Summarize the genotypes & phenotypes of the possible offspring?

	H	h	
h	Hh	hh	50% chance of Hh (horned)
h	Hh	hh	50% chance of hh (no horn)

3. In humans, the brown-eye (B) allele is dominant to the blue-eye allele (b). If two heterozygotes mate, what will be the likely genotype and phenotype ratios of the offspring.

	B	b	75% chance of brown-eyed
B	BB	Bb	25% chance of blue-eyed
b	Bb	bb	25% chance of BB
			50% chance of Bb
			25% chance of bb

quantitative genetics and the evolutionary synthesis emerged The groundbreaking theory of genetic effects was first proposed over a century ago This book revises that theory both conceptually and mathematically and brings it up to date The theory here compiled is supplemented with non previously published developments covering the broadest spectrum of simultaneously multiallelic and multilocus architectures with autosomal and sex linked loci Arbitrary interactions dominance gene gene gene environment gene sex and parent of origin interactions are accounted for Both effects of allele substitutions from the reference of individual genotypes and in the context of populations are worked out Populations are considered regardless of any departures from equilibrium frequencies including both departures from Hardy Weinberg departures from linkage equilibrium and non random associations between among genes and environments All developments are derived under the same mathematical framework so that transformations of genetic effects between different contexts are easily allowed In brief this book enables novel applications to current empirical paradigms like gene mapping and genomic prediction while adhering to the classical conceptualization of genetic effects and variance decomposition that let quantitative genetics and the evolutionary synthesis flourish All relevant concepts are carefully clarified and discussed from a historical perspective The theoretical developments presented in the book are illustrated by built in cases and applications with real data Reassuringly the adequacy of the theory here presented is corroborated based on the fundamentals of model development
