**Infertility, United States, 1982** Gerry E. Hendershot, Marjorie C. Horn, William D. Mosher, 1988 The 1982 statistics on the  
use of family planning and infertility services presented in this report are preliminary results from Cycle III of the National  
Survey of Family Growth NSFG conducted by the National Center for Health Statistics Data were collected through personal  
interviews with a multistage area probability sample of 7969 women aged 15 44 A detailed series of questions was asked to  
obtain relatively complete estimates of the extent and type of family planning services received Statistics on family planning  
services are limited to women who were able to conceive 3 years before the interview date Overall 79% of currently married  
nonsterile women reported using some type of family planning service during the previous 3 years There were no statistically  
significant differences between white 79% black 75% or Hispanic 77% wives or between the 2 income groups The 1982

survey questions were more comprehensive than those of earlier cycles of the survey. The annual rate of visits for family planning services in 1982 was 10.77 visits/1000 women. Teenagers had the highest annual visit rate, 15.81/1000, of any age group for all sources of family planning services combined. Visit rates declined sharply with age from 14.47 at ages 15-24 to 4.79 at ages 35-44. Similar declines with age also were found in the visit rates for white and black women separately. Nevertheless, the annual visit rate for black women, 13.34/1000, was significantly higher than that for white women, 10.33. The highest overall visit rate was for black women, 15-19 years of age, 18.67/1000. Nearly 2/3 of all family planning visits were to private medical sources. Teenagers of all races had higher family planning service visit rates to clinics than to private medical sources, as did black women, age 15-24. White women, age 20 and older, had higher visit rates to private medical services than to clinics. Never married women had higher visit rates to clinics than currently or formerly married women. Data were also collected in 1982 on use of medical services for infertility by women who had difficulty in conceiving or carrying a pregnancy to term. About 1 million ever married women had 1 or more infertility visits in the 12 months before the interview. During the 3 years before interview, about 1.9 million women had infertility visits. For all ever married women as well as for white and black women separately, infertility services were more likely to be secured from private medical sources than from clinics. The survey design, reliability of the estimates, and the terms used are explained in the technical notes.
