

Brake Controls, Functions, and Air Lines

Parking Brake Control: The park or emergency brake is spring applied and air released. A released valve built into the control won't allow the park brake to be released until a load pressure is put in as low as 100 psi (6.9 kPa, 1000 ft bar). The same valve allows the release of control pressure to lock. To apply the park or emergency brake, push in the control valve. To release the brake, pull out on the valve.

Service Brake Control: To apply service brakes, push control forward. To release service brakes, pull control to the rear.

Note: Don't operate an air valve until you're sure it's safe to do so.

Function Brake Control

The parking brake control actuates a spring applied, hydraulically released brake, mounted on the wheel shaft in the carrier. It is operated as follows:

- Start the engine and let the Speed-Safe® pressure build up. The pressure must be at least 100 psi (6.9 kPa, 1000 ft bar) before the brake can be released.
- Pull out on the control to release the brake.
- Push in on the control to apply the brake.

Note: The brake will apply if pressure falls below 100 psi (6.9 kPa, 1000 ft bar) after the brake is released.

Note: This brake is not used on machines with 10,000 lb (4,500 kg) capacity.

Low Air Control System

The following series of paragraphs explain the operation of the various controls on the carrier. This information should be read and thoroughly understood before attempting to operate the carrier.

Ignition Switch: The ignition switch is controlled by a key to prevent starting of the engine in unauthorized persons. The key action must be turned fully to the right to engage the engine starter.

The key must be in the on position to permit use of the accelerator.

Accelerator: The accelerator is located on the right in a.c.h., and the carrier is traveling.

Emergency Stop: The emergency stop button controls the engine air pressure group, suspension group, fuel tank group, and steering. Pushing the button shuts off air supplied to the machine for proper handling.

Fuel Tank Control: The fuel tank control is located on the right side of the carrier. Push the control to the left to read the fuel level in the l.s. tank. Push the control to the right to read the fuel level in the r.s. tank.

Service Brake Control: The stop (park) brake control, also equipped with the service brakes of all

wheels. This brake must be applied when operating from the water.

Note: Don't use the service brake for normal air pressure control.

Park or Emergency Brake Control: When the emergency or park brake control is selected, air under pressure is directed to the emergency or park brake cylinders in the rear assembly, applying the brakes on the front rear axle. The carrier cannot be moved until air in the cylinder is exhausted, allowing the return springs to release the brake. A mechanical lock in the cylinder prevents the brake releasing if air pressure
