

PHYSICAL KINETIC MOLECULAR THEORY

Learning Objectives

- to identify theoretical differences in how heat conduction occurs in the solid, liquid and gaseous states; to
- explain the contribution of the potential of the mean attractive forces to liquid heat-conductivity coefficient; to
- explain qualitatively how the liquid heat-conductivity coefficient changes with temperature.

Module 1: Representation of states in different phases

The following figure illustrates the representative particles in three phases: solid, liquid and gas.

Figure 1: Representative states of matter at different phases of matter

Modern science explains different behaviours of particles in different phases and provides a theoretical explanation for these behaviours.

Heat Conduction

- Effect of the type of arrangement of particles and interaction in gases, liquids, and solids on the rate of heat conduction; effect of potential of particles on heat conduction; effect of the potential of particles on heat conduction; effect of the potential of particles on heat conduction.

Table 1: Effect of the type of arrangement of particles on heat conduction

	SOLID STATE	LIQUID STATE	GASEOUS STATE
Effect of the type of arrangement of particles on heat conduction	Heat conduction is high in solids because the particles are closely packed together. The potential of the particles is high.	Heat conduction is high in liquids because the particles are closely packed together. The potential of the particles is high.	Heat conduction is low in gases because the particles are widely spaced. The potential of the particles is low.
