Q10-18 – Part 1

A country's electricity use is modeled as following for the European zone (see below). Suppose the consumption function is

$$Q = 100 - 0.0001P + P^2$$

where Q is a parameterized electricity consumption (megawatts) that represents a region's electricity consumption and P is the electricity price per unit.

- What happens to electricity demand when the electricity price is increased by 10 percent to $P = 100$?
- What happens to electricity supply?
- What is the new equilibrium electricity quantity (Q)?
- What is the price that would result in Q being 100? Is it higher or lower?

Q10-19 – Part 1

A country's electricity use is modeled by the following equation:

$$Q = 100 - 0.0001P + P^2 \quad \text{where } \frac{dQ}{dP} = 0 \quad \text{and } P \text{ is a constant (see below)}$$

- What is and graph the electricity demand Q by price P (show the equilibrium electricity price and demand, electricity consumption price is not fixed supply).
- Suppose a utility company's electricity production by the power. Assuming that electricity supply is fixed (constant) and the electricity equilibrium is what are the electricity price and quantity?
- What happens if the utility firm's electricity production supply is fixed the electricity demand? What is the new electricity price? What is the new electricity quantity?
- What happens if the utility firm's electricity production supply is fixed the electricity demand? What happens to electricity price and quantity?
