*Experimental evaluation of stress concentration and intensity factors* George C. Sih, 2012-12-06 Experiments on fracture of materials are made for various purposes Of primary importance are those through which criteria predicting material failure by deformation and or fracture are investigated Since the demands of engineering application always precede the development of theories there is another kind of experiment where conditions under which a particular material can fail are simulated as closely as possible to the operational situation but in a simplified and standardized form In this way many of the parameters corresponding to fracture such as toughness Charpy values crack opening distance COD etc are measured Obviously a sound knowledge of the physical theories governing material failure is necessary as the quantity of interest can seldom be evaluated in a direct manner Critical stress intensity factors and critical energy release rates are examples Standard test of materials should be distinguished from basic experiments They are performed to provide routine information on materials responding to certain conditions of loading or environment The tension test with or without a crack is among one of the most widely used tests Because they affect the results with size and shape of the specimen the rate of loading temperature and crack configuration are standardized to enable comparison and reproducibility of results The American Society for Testing Materials ASTM provides a great deal of information on recommended procedures and methods of testing The objective is to standardize specifications for materials and definition of technical terms

*Probabilistic Structural Mechanics Handbook* C.R. Sundararajan, 2012-12-06 The need for a comprehensive book on probabilistic structural mechanics that brings together the many analytical and computational methods developed over the years and their applications in a wide spectrum of industries from residential buildings to nuclear power plants from bridges to pressure vessels from steel structures to ceramic structures became evident from the many discussions the editor had with practising engineers researchers and professors Because no single individual has the expertise to write a book with such a diverse scope a group of 39 authors from universities research laboratories and industries from six countries in three continents was invited to write 30 chapters covering the various aspects of probabilistic structural mechanics The editor and the authors

believe that this handbook will serve as a reference text to practicing engineers teachers students and researchers It may also be used as a textbook for graduate level courses in probabilistic structural mechanics The editor wishes to thank the chapter authors for their contributions This handbook would not have been a reality without their collaboration

**High Sensitivity Moiré** Daniel Post,Bongtae Han,Peter Ifju,2012-12-06 Mechanical engineering an engineering discipline born of the needs of the industrial revolution is once again asked to do its substantial share in the call for industrial renewal The general call is urgent as we face profound issues of productivity and competitiveness that require engineering solutions among oth ers The Mechanical Engineering Series features graduate texts and research monographs intended to address the need for information in contemporary areas of mechanical engineering The series is conceived as a comprehensive one the will cover a broad range of concentrations important to mechanical engineering graduate education and research We are fortunate to have a distinguished roster of consulting editors each an expert in one of the areas of concentration The names of the consulting editors are listed on the first page of the volume The areas of concentration are applied mechanics biomechanics computational mechanics dynamic systems and control energetics mechanics of materials processing thermal science and tribology Professor Winer the consulting editor for applied mechanics and tribology and I are pleased to present this volume of the series High Sensitivity Moire Experimental Analysis for Mechanics and Materials by Professor Post Dr Han and Dr Ifju The selection of this volume underscores again the interest of the Mechanical Engineering Series to provide our readers with topical monographs as well as graduate texts
