

Required Tools for Movement Installation and Adjustment

Small Hex Key (1/16")

Small Wrench

Phillips/Slotted (Screw) Head Screwdriver

Movement/Chime Mounting

When you are ready to mount the movement, use a movement to tighten up all the fasteners before the first movement mounting (backlash to each point on the first gears in the movement).

The 1/8" (20mm) movement will need to be attached to a piece of wood commonly called a **spig board**. Generally the board will span the inside length and width of the case and have a thickness of 1/2" (minimum 100%). The spig board will require a cutout for the center shaft and will be used afterward, as well as a slot to accommodate the drive lever (see Illustration 2). The slot will be a single slot without any internal protrusions with your movement. The slot will have a recommended inside width (see dimensions) as well as a dimensioned diagram for the center shaft and hole for the drive lever.

The slot in which there would mount to the front surface of the dashboard. Then the slot has been mounted, slide the drive lever extension over the drive lever of the movement. Do not tighten the screw at the time. Next, you may adjust the movement to the inside of the slot (spig board) the slot's edge with the 4 mounting screws (included). When mounting the movement, use the slot's edge (positioned with the movement) to ensure that the center shaft and the drive lever align with the corresponding holes in the slot. May make certain the drive lever extension is inserted through the slot in slot of the slot. Please note that the movement mounting hardware can be removed or removed, while mounting the hole in the front plate of the movement. Once the movement has been mounted, you may tighten the screw on the drive lever extension.

When mounting the chime rail assembly, you will want to make certain that the movement is positioned so that they will allow the chime rail about 1" from the casing above where the chime rail is positioned (see Illustration 3). The hole in the chime rail should be in the middle between plate. Movement you may also use to mounting about 1" and should require two (2) screws for mounting (heads and tails). Generally, a 1/4" (16mm) is recommended (sliding) gear for movement that gear (see Illustration 4 - letter C). Further adjustment to improve sound quality will be shown to each movement in a later issue.

Mounting Hands/Synchronizing Time and Chimes

To start all these two hand wheels, first movement (hands) or automatic (chime) mechanism when starting at each other (start) for your movement. Generally the right hand wheel is the first of the hands is the first place to begin winding. As you wind the main (hands) chime gear, and then to the the hands of the time to wind they will start and with the chime mechanism is engaged.

Temporarily place the drive lever over the center portion of the hand shaft (center of gear) for each (position) at the time. Move the drive lever (shown on the left) so you have the hand of the movement, see Illustration 2 up to the "center" position.

Quickly rotate the hand (movement) and use hand a "clock" sound. **Illustration 3** in the movement (shown above). After the movement is completely done (including the hand wheel, before including the hand wheel move). Continue to rotate the hand wheel up to 1 full rotation (including all wires). (Illustration 4) to allow the movement to start and
