The findings are promising, but the system has some important limitations. It includes a number of assumptions that are based on the 1990s, current prices, fuel use, etc. It is not clear how important these limitations are to the value of the alternative electricity-generating technologies. Table 1 lists important data assumptions. Fig. 2 compares the technology and efficiency as a single figure, which the CO₂ intensity of the technology is multiplied by capacity, reflecting the ability to generate electricity. The capacity of the plants, and the development especially the growth rate, become crucial factors in determining the total CO₂ abatement. The investment prices are relatively unchanged from the 1990s (Fig. 3). It is possible to use a 2000 technology cost for nuclear, but this would be a little less (Fig. 4).

These guidelines will encourage other health-care professionals, architects and owners to rethink design, installation, use and cost of equipment in a responsible, health-conscious, safe setting with the added safety for the patient, the health-care worker, the visitor, the caregiver and the community. The guidelines will be adopted by the American Society of Health-System Executives, the American Hospital Association, and numerous organizations of hospitals, health-care associations, and health-care workers.

The 1980-1990 economic crisis has had deep effects, above all, among the poorest of populations, hindering the economic development and social mobility of the entire society. In this context, the role of construction plays the subsequent stages of the economic life cycle, thus dealing with the rising of a new society.
