A 14-year-old patient sustained a displaced fracture of the radius and ulna after falling from a bicycle. Which of the following pain control interventions is most likely to result in improvement in symptoms related to pain? - answer Applying a splint to the affected extremity

Rationale

Splinting is an effective non-pharmacologic intervention to reduce pain associated with fractures. This will also help to minimize complications. Topical creams and elevation of the extremity will not help with pain control. The application of ice in an appropriate manner can help, but not warmth which would be contraindicated in the early stages of the injury.

Assessment of the fontanelle provides the most useful information for which two components of the primary survey? - answer Circulation and disability

Rationale

A sunken fontanelle is a red flag for circulation assessment in pediatric triage and may indicate dehydration. A bulging fontanel is a red flag for disability assessment in pediatric triage and can indicate increased intracranial pressure.

A 6-month-old is seen for a recurrent respiratory infection. During the assessment, the mother adds that the patient's stools seem to be fatty or "greasy". Which of the following disease processes would be a primary concern for this child? - answer Cystic fibrosis

Rationale

In patients with cystic fibrosis, thick mucus inhibits the release of pancreatic enzymes necessary for digestion. This results in impaired absorption and the inability to utilize ingested fats. These fats are excreted in the stools and can present as "fatty" or "greasy". Combined with the recurrent upper respiratory infections for an infant, cystic fibrosis should be ruled out. The other three disease processes frequently present with respiratory issues but fatty stools would not normally be seen.

Damage Assessment and Reconstruction after War or Natural Disaster Adnan Ibrahimbegovic, Muhamed Zlatar, 2009-05-14 1 1

SAFETY OF CIVIL STRUCTURES Society expects that the failure of civil structures is extremely rare and relies on the care and expertise of the professionals involved in the design construction and maintenance of structures This is in particular true for public technical systems such as transportation or energy supply systems and structures such as bridges Structural safety may be defined as follows Adequate safety with respect to a hazard is ensured provided that the hazard is kept under control by appropriate measures or the risk is limited to an acceptable value Absolute safety is not achievable It is thus not the structure as such that is designated safe but rather the people goods and the environment in its surroundings The continued use of existing structures is of great importance because the built environment is a huge economic and political asset growing larger every year Nowadays evaluation of the safety of existing structures is a major engineering task and structural engineers are increasingly called upon to devise ways for extending the life of structures whilst observing tight cost constraints Also existing structures are expected to resist against accidental actions although they were not designed for Engineers may apply specific methods for evaluation in order to preserve structures and to reduce a client's expenditure The ultimate goal is to limit construction intervention to a minimum a goal that is clearly in agreement with the principles of sustainable development
