GIS and Remote Sensing Applications in Biogeography and Ecology Andrew C. Millington,Stephen J. Walsh,Patrick E. Osborne,2013-03-11 In recent years the conservation of tropical forests has received worldwide publicity whereas effective forest management particularly for timber extraction has attracted little attention and gained some notoriety The overall aim of the present paper was to examine how environmental micro variation in the Chiquibul Forest Reserve of Belize can influence species distribution and thereby inform management strategy The paper deals first with the background to forest management in Belize then considers the methodology used in the present study and finally assesses the preliminary results The specific objectives are 1 to assess the effects of changing scale on the variability of selected individual soil properties in forest plots within the same vegetation class and 2 to examine the variation in soil properties and tree species distribution

and to integrate environmental and ecological data over a range of scales BACKGROUND Whereas the global and regional distribution of tropical forests is broadly governed by climatic and altitudinal variation individual forest tracts need to consider a range of other locally important factors to explain species distribution and change With very high species diversity tropical forests present a major challenge in the attempt to unravel controlling factors in distribution and growth Swaine et al 1987 Research that attempts to explain diversity has looked at species distribution according to a range of factors with a general recognition that soil fertility plays a significant if ill defined role Swaine 1996 *Proceedings RMRS.* ,1998

Survival and Sustainability Hüseyin Gökçekus,Umut Türker,James W.
