Optimization of Multistage Hydraulic Fracturing Treatment for Maximization of the Tight Gas Productivity Mengting Li, 2018-12-17 Hydraulic fracturing is essential technology for the development of unconventional resources such as tight gas So far there are no numerical tools which can optimize the whole process from geological modeling hydraulic fracturing until production simulation with the same 3D model with consideration of the thermo hydro mechanical coupling In this dissertation a workflow and a numerical tool chain were developed for design and optimization of multistage hydraulic fracturing in horizontal well regarding a maximum productivity of the tight gas wellbore After the verification a full 3D reservoir model is generated based on a real tight gas field in the North German Basin Through analysis of simulation results a new calculation formula of FCD was proposed which takes the proppant position and concentration into account and can predict the gas production rate more accurately However not only FCD but also proppant distribution and hydraulic connection of stimulated fractures to the well geological structure and the interaction between fractures are determinant for the gas production volume Through analysis the numerical results of sensitivity analysis and optimization variations there is no unique criterion to determine the optimal number and spacing of the fractures it should be analyzed firstly in detail to the actual situation and decided then from case to case Polymer

Thermodynamics Kal Renganathan Sharma, 2011-10-10 Polymer Thermodynamics Blends Copolymers and Reversible Polymerization describes the thermodynamic basis for miscibility as well as the mathematical models used to predict the compositional window of miscibility and construct temperature versus volume fraction phase diagrams The book covers the binary interaction model the solubility parameter approach and the entropic difference model Using equation of state EOS theories thermodynamic models and information from physical properties it illustrates the construction of phase envelopes The book presents nine EOS theories including some that take into account molecular weight effects Characteristic values are given in tables It uses the binary interaction model to predict the compositional window of miscibility for copolymer

homopolymer blends and blends of copolymers and terpolymers with common monomers It discusses Hansen fractional solubility parameter values six phase diagram types the role of polymer architecture in phase behavior and the mathematical framework for multiple glass transition temperatures found in partially miscible polymer blends The author also illustrates biomedical and commercial applications of nanocomposites the properties of various polymer alloys Fick's laws of diffusion and their implications during transient events and the use of the dynamic programming method in the sequence alignment of DNA and proteins The final chapter reviews the thermodynamics of reversible polymerization and copolymerization Polymer blends offer improved performance cost ratios and the flexibility to tailor products to suit customers needs Exploring physical phenomena such as phase separation this book provides readers with methods to design polymer blends and predict the phase behavior of binary polymer blends using desktop computers
