Read the following passage, and answer the questions below.

At one time, most of the people living in Bangladesh depended upon surface water for their fresh water needs. This water was contaminated with pathogens that caused a high incidence of disease and death in the population. A system of rural wells was then built to provide safe drinking water for most of the people in Bangladesh. Now Bangladesh is trying to respond to another crisis. These new wells draw groundwater that is contaminated with arsenic. According to the World Health Organization, an estimated 35 to 77 million of the total 125 million residents are at risk of drinking arsenic-contaminated water. Drinking water with a high concentration of arsenic can cause a variety of illnesses, including lung, bladder, and skin cancers. Adding alum is a simple and inexpensive way to remove most of the arsenic from drinking water. This method is one of several temporary solutions that are being used to reduce the level of arsenic and to make the water usable.

8. The diagram in this chapter shows how alum is used in large-scale treatment of drinking water. How could a single household or village use this method to treat well water?
