

Chemistry – Unit 7 Review

Chemical Reaction Model

1. Describe key characteristics of all chemical reactions, including the role of energy. Explain how a balanced equation represents these features (include an example).

In chemical reactions, atoms of the reactants recombine to form new substances in the products. There is almost always some transfer between the thermal and chemical energy accounts as well as an exchange of thermal energy via heating (Q) between the system and surroundings. The balanced chemical equation represents this process symbolically, showing that the atoms in the products are the same as those in the reactants

Note: there are 4 atoms of H and 2 atoms of O on each side of the equation.

Applying the Model

2. Balance the reaction below by drawing any additional reactant and/or product molecules that would be needed.

Write the **balanced equation** for this reaction.

Which of these molecules would be called reactants?

DB₂, CD₂, and BAC are reactants

Chemical and Biogeochemical Processes at Methane and Other Cold Seeps Davide Oppo,Dong Feng,Samantha Joye,Jörn Peckmann,Jennifer Zwicker,2023-10-31 Methane is a strong climate active gas the concentration of which is rapidly increasing in the atmosphere Vast methane reservoirs are hosted in seafloor sediments both dissolved in pore fluids and trapped in gas hydrate Cold seeps discharge significant amounts of this methane into the ocean The rate of seabed methane discharge could be orders of magnitude higher than current estimates creating considerable uncertainty The extent of methane transfer from the seafloor to the water column and ultimately to the atmosphere is also uncertain The seepage of methane and other hydrocarbons drives complex biogeochemical processes in marine sediments and the overlying water column Seeps support chemosynthesis based communities and impact the chemistry of the water column Seeps may also play a critical role in ocean acidification and deoxygenation and can be geohazards as well as a potential energy resource Unraveling the complex and dynamic interactions and processes at marine seeps is crucial for our understanding of element cycling in the geo and hydrosphere

The British National Bibliography Arthur James Wells,1994 The Late Eocene Earth Christian Koeberl,Alessandro Montanari,2009 The Late Eocene and the Eocene Oligocene E O transition mark the most profound oceanographic and climatic changes of the past 50 million years of Earth history with cooling beginning in the middle Eocene and culminating in the major earliest Oligocene Oi 1 isotopic event The Late Eocene is characterized by an accelerated global cooling with a sharp temperature drop near the E O boundary and significant stepwise floral and faunal turnovers These global climate changes are commonly attributed to the expansion of the Antarctic ice cap following its gradual isolation from other continental masses However multiple extraterrestrial bolide impacts possibly related to a comet shower that lasted more than 2 million years may have played an important role in deteriorating the global climate at that time This book provides an up to date review of what happened on Earth at the end of the Eocene Epoch Microbial Landscape Ecology: Highlights on the Invisible Corridors Cendrine Mony,Brendan J.
