

The optical system of a telescope is similar to that of a compound microscope. In both instruments, the image formed by an objective lens is viewed through an eyepiece. The key difference is that the telescope is used to view large objects at large distances and the microscope is used to view small objects at a very close distance.

An astronomical telescope is a telescope that uses lens as an objective. It is called a **refracting telescope**. In the reflecting telescope the objective lens is replaced by a concave mirror.

What is a Hubble Space Telescope?

The Hubble Space Telescope (HST) is not only a telescope with scientific instruments. It is also a spacecraft and has power to move in orbit. A HST enables astronomers to look out at a distant star or nebula with amazing clarity. With such telescope you could peer billions of light years away and see things that happened billions of years ago.

The space telescope was named after American astronomer Edwin Hubble, whose observation of variable stars in distant galaxies confirmed that the universe was expanding and gave support to the "Big Bang Theory".
