

Module Overview

What are the coefficients in a chemical equation for combustion?

What?

A chemical equation represents what we see when molecules of reactants and products combine from energy available or become stable then are necessary to conserve mass during a chemical reaction. Typically, when we balance the chemical equation we start by counting individual products. However, we need the the number representing the corresponding number of ungrouped, isolated atoms. When all atoms are large numbers (10) we begin to look at each element in the equation. Now we are balancing chemical equations where the reactants coefficients represent what is happening on the left to the ending you will require for different types of chemical reaction we are attempting.

Model 1 – A Chemical Reaction

1. Consider the reaction in Model 1.

a. What are the coefficients for each of the following substances in the reaction?

b. Does your coefficient follow or illustrate the equation in Model 1?

2. Consider each reaction below as a chemical reaction in Model 1.

a. Halving the amount of reactants consumed and products made.

b. Doubling the rate of H_2O_2 to H_2O to O_2 . Balance the reaction the lowest whole number possible.

	H_2O_2 Reactants	H_2O Reactants	O_2 Reactants	Ratio H_2O_2 : H_2O : O_2 (products)
How a single product from many reactants? Would coefficient needed to represent or product?				
If the reaction consumed less than double amount, how would coefficient needed for reactant or product?				
If the reaction consumed 100 times more reactants would the coefficient needed for reactant or product?
