

Experiment #9 – Conservation of Linear Momentum

Date of Performance: November 03, 2016

Group: Simona Khan, Brandon Byars, Jewel Taylor, Bella Zilber

Object of Experiment: Our objective is to examine and understand the Law of Conservation of Linear Momentum through our experiment. Our apparatus will allow us to analyze this through the elastic collision of two objects.

Theory of Experiment: In order to achieve our objective in this experiment, we must first understand how our apparatus works. We are given an air track system with two gliders, along with photogate timer and accessory photogate. The air track creates an environment in which there is minimal friction between the track and the gliders. This is perfect way to investigate linear momentum. Eliminating friction is quite important because it confirms that there will be no external force to act upon the system, which is a major condition that is needed to satisfy the conservation of momentum. Each glider has a bumper attached to it to provide the elastic collision that is needed. In our case, the bumper is a rubber-band. Similar to previous experiments, the gliders have a flag (ΔL) mounted to the top of them. Once the flags pass through the photogates, the time will be measured.

$$p = mv,$$

p , being momentum; m , being mass of object; v , being velocity of object

For two-object collision, momentum conservation is ideally stated by the equation:

$$P_i = m_1v_{i1} + m_2v_{i2} = m_1v_{f1} + m_2v_{f2} = P_f$$

Data: Raw data signed and attached.

$$\Delta L_2 = 1.1 \text{ cm}$$
