

# Genetic Maps

- Genes are shown in relative order and distance from each other based on pedigree studies.
- The chance of the chromosome breaking between A & C is higher than the chance of the chromosome breaking between A & B during meiosis.
- Similarly, the chance of the chromosome breaking between E & F is higher than the chance of the chromosome breaking between F & G.
- The closer two genes are, the more likely they are to be inherited together (co-occurrence).
- If pedigree studies show a high incidence of co-occurrence, those genes will be located close together on a genetic map.

Evolution of Membrane Signaling and Trafficking in Plants Markus Geisler, Angus S. Murphy, Heven Sze, 2013-06-12 Membrane proteins are essential determinants of many biological processes in plants They function in metabolic processes signal transduction transport of small molecules and polymers across endo and plasma membranes and intercompartmental trafficking of proteins lipids and cell wall components During these integrative processes dynamic interactions of membrane proteins with other membrane or soluble components are thought to provide a high degree of flexibility that usually characterizes higher plants This concept is supported by the recent release of a first partial Arabidopsis interactome by the Arabidopsis Interactome Mapping Consortium <http://www.sciencemag.org/content/333/6042/601.full.htm> The Arabidopsis interactome reveals a strong enrichment of a few network communities including those for transmembrane transport and vesicle trafficking Strikingly the large transmembrane transport community shares a high amount of proteins with the vesicle trafficking community suggesting a strong physical and functional overlap and interaction
