strategy must redirect its efforts into other regions of the space This dissertation describes a connectionist learning machine that produces a search strategy called stochastic iterated genetic hillclimb ing SIGH Viewed over a short period of time SIGH displays a coarse to fine searching strategy like simulated annealing and genetic algorithms However in SIGH the convergence process is reversible The connectionist implementation makes it possible to diverge the search after it has converged and to recover coarse grained information about the space that was suppressed during convergence The successful optimization of a complex function by SIGH usually involves a series of such converge diverge cycles
