Jr. Lewis, J. F. Saunders, D. W. Crumpacker, C. M. Bredecke, 2012-12-06 Nutrient enrichment eutrophication is a major theme in freshwater ecology Some themes come and go but the inevitable release of phosphorus and nitrogen that accompanies human presence seems to ensure that eutrophication will not soon become an outmoded subject of study Eutrophication raises issues that range from the pressingly practical problems of phosphorus removal to the very fundamental ecological questions surrounding biological community regulation by resource supply Although it is possible to take a reductionist approach to some aspects of eutrophication the study of eutrophication is fundamentally a branch of ecosystem ecology To understand eutrophication in a given setting one is inevitably forced to consider physical chemical and biological phenomena together Thus while eutrophication is the focus of our study of Lake Dillon we have assumed that a broad base of limnological information is a prerequisite foundation Eutrophication of a lake can be studied strictly from a limnological perspective If so the nutrient income of the lake is quantified but the sources are combined within a black box whose only important feature is total loading It is also possible however to treat the watershed and lake as equally important components of a hybrid system In this case the nutrient sources must be dissected and their variability and dependence on key factors such as runoff must be quantified *Eutrophication of Waters*, 1982 *Eutrophication of Freshwaters* David Harper, 2012-12-06 Eutrophication is a problem which became widely recognised by the scientific community in the 1940s and 1950s It raised public concern resulting in increased research effort and expenditure on management techniques through the 1960s and 1970s recognised as a distinct problem of water pollution though linked with the more gross effects of organic pollution In the 1980s it became less fashionable replaced in the public's eye and the politician's purse by newer problems such as acid rain It remains however one of the biggest and most widespread problems of fresh waters particularly of lakes and an increasing problem for estuaries and coastal waters It is one with which almost all water scientists and engineers in urbanised areas of the world have to cope Technical methods for the reversal of eutrophication such as nutrient removal have been developed and applied successfully in some instances They are not widespread however and where they are feasible they are often expensive and may be politically difficult to implement In the last decade attention has focussed upon less expensive lake manipulation techniques such as destratification and biomanipulation which aim to minimise rather than eliminate the detrimental effects of eutrophication These are becoming more widely applied Prediction of the potential problems in lakes and catchments which have not yet suffered the full effects of eutrophication is now accurate enough to be of direct benefit to river basin management **Marine Eutrophication**, 1990 *Eutrophication: causes, consequences and control* Abid A.
