

INTRODUCTION: Evidence has been found to indicate that living things have changed gradually during their natural history. The study of fossils as well as embryology, biochemistry, and comparative anatomy provides evidence for evolution.

OBJECTIVE: In this lab activity you will learn about homologous, analogous, vestigial structures, fossils, embryology and biochemistry and their significance in evolution theory.

MATERIALS: Map Pencils

PROCEDURES:

I. COMPARATIVE ANATOMY

HOMOLOGOUS STRUCTURES

1. Carefully examine the drawings of the bones. Look for *similarities* among the various animals.
 - a. **COLOR** each part of the human arm a different color. (All bones of the wrist should be the same color, the bone groups of the hand should be a different single color.) Then **color** the corresponding bone in each of the other animals the same color as the human bone.
 - b. In Table 1 (question #2 on the *Answer Sheet* describe the **function** of each set of bones and answer the question.)

ANALOGOUS STRUCTURES

2. Examine the butterfly wing and the bird wing. Answer questions 4 - 6 on the answer sheet.

VESTIGIAL STRUCTURES

Gradual changes have occurred through time that have in some cases reduced or removed the function of some body structures and organs. The *penguin's wings* and the *leg bones of snakes* are examples of this phenomenon.

3. The cave fish and minnow are related, but the cave fish is blind. Answer questions 7-8 on the answer sheet.

4. Read the list of *human vestigial* structures in Table 2 (question #9). Suggest a *possible function* for each structure and explain *why* it became vestigial. Then complete questions 10 -12

Evidence For Evolution Dry Lab:

The Evolution of Imperfection Laurence D. Hurst, 2025-04-08 How understanding our genetic imperfections can change our view of evolution and enrich what it means to be human If we start with the presumption that evolution is a constantly improving process some aspects of our evolution just do not make sense We have a high rate of genetic diseases for example and much of our DNA seems to be pointless In *The Evolution of Imperfection* Laurence Hurst explores our apparently rotten genetic luck Hurst a leading authority on evolution and genetics argues that our evolutionary imperfections proceed directly from two features the difficulties of pregnancy and the fact that historically there are relatively few of us In pregnancy natural selection can favor chromosomes that kill embryos in species including ours that continuously receive resources from the mother Most fertilized eggs don't make it and incompatibilities between the fetus and mother can lead to lethal disorders of pregnancy The historically small population size enhances the role of chance which in turn leads to both accumulation of unnecessary DNA and more mutation So what can save us One answer may lie in genetic medicine which has given us therapies that make killer conditions preventable and even curable Hurst suggests that our seeming imperfections could be the key to a new way to understand evolution itself Looking at circumstances that seem to defy explanation we might come to a richer understanding of how evolution really works and what it means to be human

Challenges and Opportunities in Orchid Ecology and Conservation Pavel Kindlmann, Tiiu Kull, Dennis Whigham, 2023-08-02 Understanding diversity patterns and the effect of global change on abundance distribution patterns and species survival are of the most discussed topics in biodiversity research Species are disappearing worldwide mostly due to habitat loss but other factors like climate change are likely to increase in importance during the 21st century Thus one of the most worrying issues is that we still do not know the optimal abiotic and biotic requirements for population persistence of many of the still existing species which makes it very difficult if not impossible to make appropriate recommendations for their conservation in terms of proposing an effective management of their sites Analysis of these requirements is however strongly dependent on the taxonomic group considered and on life history strategies of the species that comprise the group In this Research Topic we concentrate on this issue applied to orchids one of the most abundant groups of flowering plants with approximately 30 000 species They are classified among the most threatened groups worldwide Of the approximately 1000 species that have been evaluated almost 60% are threatened endangered or extinct For a few orchid species detailed records from monitoring efforts provide opportunities for comparative analyses of species declines through time However for most orchid species we still lack population data and there have been few studies that have focused on the environmental factors and species traits associated with the decline of orchid sites and species numbers

Fins into Limbs Brian K. Hall, 2008-09-15 Long ago fish fins evolved into the limbs of land vertebrates and tetrapods During this transition some elements of the fin were carried over while new features developed Lizard limbs bird wings and human arms and legs are therefore all evolutionary modifications of the original

tetrapod limb A comprehensive look at the current state of research on fin and limb evolution and development this volume addresses a wide range of subjects including growth structure maintenance function and regeneration Divided into sections on evolution development and transformations the book begins with a historical introduction to the study of fins and limbs and goes on to consider the evolution of limbs into wings as well as adaptations associated with specialized modes of life such as digging and burrowing Fins into Limbs also discusses occasions when evolution appears to have been reversed in whales for example whose front limbs became flippers when they reverted to the water as well as situations in which limbs are lost such as in snakes With contributions from world renowned researchers Fins into Limbs will be a font for further investigations in the changing field of evolutionary developmental biology

Fundamentals of Anorectal Surgery David E. Beck, Scott R. Steele, Steven D. Wexner, 2018-12-24 This book is a comprehensive and current guide to the diagnosis and treatment of the entire spectrum of anorectal diseases It focuses mainly on anorectal problems as anorectal pathology is often more complex and challenging for surgeons than colonic diseases The book covers anorectal anatomy physiology and embryology as a foundation to a detailed description of preoperative intraoperative and post operative patient management All surgical procedures are shown in step by step detail by leading surgeons and gastroenterologists This book will be relevant to general colon and rectal surgeons in training and practice gastroenterologists and other practitioners with an interest in anorectal diseases
