**Knowledge Acquisition for Expert Systems** A. Kidd, 2012-12-06 Building an expert system involves eliciting analyzing and interpreting the knowledge that a human expert uses when solving problems Experience has shown that this process of knowledge acquisition is both difficult and time consuming and is often a major bottleneck in the production of expert systems Unfortunately an adequate theoretical basis for knowledge acquisition has not yet been established This requires a classification of knowledge domains and problem solving tasks and an improved understanding of the relationship between knowledge structures in human and machine In the meantime expert system builders need access to information about the techniques currently being employed and their effectiveness in different applications The aim of this book therefore is to draw on the experience of AI scientists cognitive psychologists and knowledge engineers in discussing particular acquisition techniques and providing practical advice on their application Each chapter provides a detailed description of a particular technique or methodology applied within a selected task domain The relative strengths and weaknesses of the technique are summarized at the end of each chapter with some suggested guidelines for its use We hope that this book will not only serve as a practical handbook for expert system builders but also be of interest to AI and cognitive scientists who are seeking to develop a theory of knowledge acquisition for expert systems

**VHDL for Simulation, Synthesis and Formal Proofs of Hardware** Jean Mermet, 2012-12-06 The success of VHDL since it has been balloted in 1987 as an IEEE standard may look incomprehensible to the large population of hardware designers who had never heard of Hardware Description Languages before for at least 90% of them as well as to the few hundreds of specialists who had been working on these languages for a long time 25 years for some of them Until 1988 only a very small subset of designers in a few large companies were used to describe their designs using a

proprietary HDL or sometimes a HDL inherited from a University when some software environment happened to be developed around it allowing usability by third parties A number of benefits were definitely recognized to this practice such as functional verification of a specification through simulation first performance evaluation of a tentative design and sometimes automatic microprogram generation or even automatic high level synthesis As there was apparently no market for HDL s the ECAD vendors did not care about them start up companies were seldom able to survive in this area and large users of proprietary tools were spending more and more people and money just to maintain their internal system *Journal of Research of the National Bureau of Standards* United States.
