

- a. Retain the default selection of **Normal to Boundary** from the **Backflow Direction Specification Method** drop-down list.

In problems where a backflow exists at the pressure outlet boundary (for example, a torque-converter), you can use this option to specify the direction of the backflow.

- b. Enable the **Radial Equilibrium Pressure Distribution** option.

This option accounts for the pressure distribution that results from rotation by calculating the pressure gradient according to

$$\frac{\partial p}{\partial r} = \frac{\rho v_{\theta}^2}{r}$$

where v_{θ} is the tangential velocity. This option is appropriate for axial flow configurations with relatively straight flow paths (that is, little change in radius from inlet to exit).

- c. Retain the default selection of **Intensity and Viscosity Ratio** from the **Specification Method** drop-down list.
- d. Enter 1% for **Backflow Turbulent Intensity**.
- e. Enter 1 for **Backflow Turbulent Viscosity Ratio**.
- f. Click **OK** to close the **Pressure Outlet** dialog box.

7. Retain the default conditions for the **rotor-hub**.
