Computer and Communications Industry Martin Fransman, 1995 This work draws on and extends the theoretical framework developed by such authors as Richard Nelson Sidney Winter David Teece Alfred Chandler Nathan Rosenberg and Christopher Freeman through an empirical analysis of the evolution of the Japanese information and communications IC industry Particular attention is paid to the development of a theory of the firm which is consistent with this empirical objective The Japanese IC industry contains three main segments computers and software telecommunications equipment and semiconductors The work asks How did such Japanese companies as NTT NEC Fujitsu Hitachi Toshiba and Sumitomo Electric manage to catch up and become some of the largest companies in the world Why have they not been as successful in global markets as their counterparts in consumer electronics and automobiles What role was played by NTT s system of controlled competition and by MITI Based on over 600 personal interviews over eight years with Japanese leaders this book provides new analyses and empirical material on this crucial industry *Strategic Industrial Sourcing* Toshihiro Nishiguchi, 1994 A major aspect of Japan s international economic success has been its industrial firms ability to develop a system of subcontracting with suppliers Through an exploration of the evolution of subcontracting in Japan as well as an analysis of its current practice in advanced economies Nishiguchi reveals what he believes to be the shortcomings of existing theories of contractual relations He shows that subcontracting can be described as the evolutionary product of complex historical interaction among social political technological and company level strategic plans but not one constrained by culture This makes it possible for other countries to use models similar to those employed in Japan encouraging continuous improvement in product quality and cost reduction

Mobile Virtual Synchronous Machine for

Vehicle-to-Grid Applications Christopher Pelczar,2012-03-23 The Mobile VISMA is a power electronics device for V2G applications which behaves like an electromechanical synchronous machine and offers the same beneficial properties to the power network increasing inertia in the system stabilizing the grid voltage and providing a short circuit current in case of grid faults The VISMA performs a real time simulation of a synchronous machine and calculates the phase currents that an electromagnetic synchronous machine would produce under the same local grid conditions These currents are fed into the grid using a current controlled inverter In this dissertation the requirements for a machine model suitable for the VISMA are set and a mathematical model suitable for use in the VISMA algorithm is found and implemented A new hardware architecture for the Mobile VISMA based on microcontroller and FPGA technologies is presented The new architecture allows the reduction of the size and cost of the VISMA making it suitable for installation in electric vehicles A simulation model of the inverter hardware and hysteresis current controller is created and validated by experiment The verified hardware model is then used to design a new type of PWM based current controller The performance of the hysteresis and PWM based current controllers is evaluated and compared Finally the behavior of the VISMA during power network faults is examined and it is shown that the VISMA inverter hardware and current controllers are capable of fault ride through and can support the power network during faults Official Gazette of the United States Patent and Trademark Office ,2000
