Cranes are a major part of the construction and manufacturing industry. Most of the new architecture and industries relies on different types of cranes to operate or be built. The main objective of this project is to design a gantry crane that will be automated with the help of a raspberry pi and sensors to automatically move the trolley to the location of the package to lift it and place it in the desired location. Different options were looked at and a decision matrix was formed to choose the best option according to the weighted criteria. A detailed design was made of the required crane and trolley and the most suitable option available in the market was ordered. The trolley was modified with different manufacturing processes to add different parts to it to make it ready for automation. A control system was implemented to the design which consists mainly of a raspberry pi relay switch camera sensor and speed control unit. The results obtained from the finite element analysis for a force on the lower plate of the trolley was 0.00614 mm of deformation on the center point and the equivalent Von Mises stress was found out to be 4.3287 MPa.
