E. Rehfeldt, 2004 A series of common garden studies of 336 populations representing *Picea engelmannii* *P pungens* *P glauca* *P mexicana* and *P chihuahuana* provided as many as 13 growth and morphologic characters pertinent to

biosystematics and genecology Canonical discriminant analyses discretely segregated populations of *P. pungens* and *P. chihuahuana* while positioning *P. engelmannii* populations along a continuum anchored by Southwestern United States populations at one extreme and those classified as hybrids of *P. engelmannii* with *P. glauca* on the other A population of *P. mexicana* was closely aligned with Southwest populations of *P. engelmannii* while populations of *P. glauca* were intermixed with and peripheral to those identified as hybrid While consistent with most taxonomic treatments of these taxa the analyses nonetheless suggested that Southwestern United States populations should be considered as a variety of *P. engelmannii* that most likely should include *P. mexicana* Genecological analyses detected ample genetic variation among the 295 populations in the *P. engelmannii* complex The analyses demonstrated that populations were distributed along clines driven primarily by the winter temperature regime of the provenance For northern populations summer temperatures also became a key factor in accounting for genetic differences among populations Analyses also detected clines for the 19 *P. pungens* and 23 *P. glauca* populations An assessment of the effects of global warming according to the IS92a scenario of two general circulation models demonstrated for the current century 1 an increasingly favorable climate for *P. pungens* as its distribution moves upward in elevation throughout much of the Great Basin Colorado Rockies and mountain islands of the Southwest 2 a widespread reduction in the areal extent of *P. engelmannii* in the inland Northwestern United States to the extent that *Picea* may become rare in the local flora 3 extirpation of *P. glauca* from the Black Hills and Cypress Hills and 4 a widespread redistribution of genotypes across the landscape as contemporary populations adjust genetically to change

Advances and Trends in Development of Plant Factories Alejandro Isabel Luna-Maldonado, Juan Antonio Vidales-Contreras, Humberto Rodríguez-Fuentes, 2017-03-22 The plant factory is a facility that aids the steady production of high quality vegetables all year round by artificially controlling the cultivation environment e.g. light temperature humidity carbon dioxide concentration and culture solution allowing growers to plan production By controlling the internal environment plant factories can produce vegetables about two to four times faster than by typical outdoor cultivation In addition as multiple cultivation shelves a multi shelf system are used the mass production of vegetables in a small space is facilitated This research topic presents some new trends on intelligent measuring systems environment controlled and optimization flavonoids phenylpropanoids transcriptomes and bacteria
