Biology and Biotechnology of the Plant Hormone Ethylene II A.K. Kanellis, C. Chang, H. Klee, A.B.

Bleecker, J.C. Pech, Donald Grierson, 2012-12-06 The inflorescence of the monoecious maize plant is unique among the Gramineae in the sharp separation of the male and female structures The male tassel at the terminus of the plant most often sheds pollen before the visual appearance of the receptive silks of the female ear at a lateral bud normally at the 10 leaf I Earlier studies examined the ontogeny of the growing tissues beginning with the embryo in the kernel through to the obvious protuberances of the growing point as the kernel germinates The differentiated developing soon to become tassel and the lateral bulges that develop into the ears on the lateral buds become apparent very early in the germinating kernel 2 3 4 6 A certain number of cells are destined for tassel and ear development 8 As the plant develops there is a phase transition 3 16

from the vegetative lateral buds to the reproductive lateral buds This change in phase has been ascribed to genotypic control as evidenced in the differences among different genotypes in the initiation of the reproductive I The genetic control of tassel and ear initiation has been gleaned from anatomical observations Lejeune and Bernier I2 found that maize plants terminate the initiation of additional axillary meristems at the time of tassel initiation This would indicate that the top most ear shoot is initiated on the same day as the initiation of tassel development and this event signals the end of the undifferentiated growing point

Ethylene and Plant Development J. A. Roberts, G. A. Tucker, 2013-10-22 Ethylene and Plant Development documents the Proceedings of the Thirty ninth University of Nottingham Easter School in Agricultural Science held at Sutton Bonington on 26-30 March 1984 The conference was entitled Ethylene and Plant Development and included a workshop organized in conjunction with the Association of Applied Biologists on the Practical control of ethylene in fruit vegetables and flowers This volume contains a mixture of review and research papers thus giving a thorough coverage on the subject The workshop reviewed the practical methods and advantages of either applying ethylene to or removing ethylene from various commercial products The rest of the conference dealt with the more fundamental aspects of ethylene synthesis and action during the developmental processes in which the gas is active Emphasis was particularly placed on the effects of ethylene on gene expression and cell development since advances in these areas may eventually lead to a more scientifically based control of ethylene levels and action within the plant

Ethylene's Role in Plant Mineral Nutrition Francisco Javier Romera, Aaron P. Smith, Rafael Pérez-Vicente, 2016-09-07 Terrestrial plants are sessile organisms that differently from animals can not move in searching of the nutrients and water they need Instead they have to change continuously their physiology and morphology to adapt to the environmental changes When plants suffer from a nutrient deficiency they develop physiological and morphological responses mainly in their roots aimed to facilitate the acquisition and mobilization of such a nutrient Physiological responses include some ones like acidification of the rhizosphere and release of chelating agents into the medium and morphological responses include others like changes in root architecture and development of root hairs The regulation of these responses is not totally known but in the last years different plant hormones and signaling substances such as auxin ethylene cytokinins and nitric oxide have been involved in their control Besides hormones oxidative stress has also been related with most of the nutrient deficiencies The relationship of ethylene with the regulation of responses to nutrient deficiencies came from the nineties when some works presented data suggesting its involvement in the regulation of responses to Fe and P deficiency In the last years the role of ethylene has been extended to many other nutrient deficiencies such as K deficiency Mg deficiency S deficiency N deficiency and others In most of the cases it has been found

that ethylene production as well as the expression of ethylene synthesis genes increases under these nutrient deficiencies. Furthermore, it has also been found that ethylene controls the expression of genes related to responses to different deficiencies. The involvement of ethylene in so many deficiencies suggests that it should act in conjunction with other signals that would confer nutrient specificity to the distinct nutrient responses. These other signals could be plant hormones auxin, cytokinins, etc., as well as other substances nitric oxide, microRNAs, peptides, glutathione, etc., either originated in the roots or coming from the shoots through the phloem. The role of ethylene in the mineral nutrition of plants is even more complex than the one related to its role in the responses to nutrient deficiencies. Ethylene has also been implicated in the N₂ fixation of legume plants in salt tolerance responses and in responses to heavy metals such as Cd toxicity. All these processes are related to ion uptake and consequently are related to plant mineral nutrition. We consider a good opportunity to review all this information in a coordinated way. This Research Topic will provide an overview about the role of the plant hormone ethylene on the regulation of physiological and morphological responses to different nutrient deficiencies. In addition, it will cover other aspects of ethylene related to plant nutrition such as its role on salinity, N₂ fixation and tolerance to heavy metals.

Cellular and Molecular Aspects of the Plant Hormone Ethylene J.C. Pech, A. Latché, C. Balagué, 2013-06-29. The International Symposium on Cellular and Molecular Aspects of Biosynthesis and Action of the Plant Hormone Ethylene was held in Agen, France, from August 31st and September 4th 1992. The planning and management of the scientific and social programme of the Conference were carried out jointly by the Ethylene Research Group of ENSA INP Toulouse and Agropole. Since the last meetings in Israel 1984 and in Belgium 1988, ethylene physiology has gone through a period of exciting progress due to new developments in cellular and molecular biology. New methods and tools have been developed to better understand the role and functions of ethylene in fruit ripening, flower senescence, abscission, plant growth and cell differentiation. Genes involved in ethylene biosynthesis have been characterized and transgenic plants with altered ethylene production have been generated. The feasibility of delaying fruit ripening or flower senescence by genetic manipulation is now demonstrated, thus opening new perspectives for the postharvest handling of plant products. Some progress has also been made on the understanding of ethylene action. However, much remains to be done in this area to elucidate the ethylene signal transduction pathway. Around 140 scientists from 20 countries attended the Symposium. They presented 47 oral reports and 40 poster demonstrations. All of them are published in these proceedings. It has been a pleasure for us to organize this important Symposium and to edit this book.

Biology and Biotechnology of the Plant Hormone Ethylene A.K. Kanellis, Caren Chang, H. Kende, Donald Grierson, 1997-04-30. Ethylene is a simple gaseous plant hormone produced by higher plants, bacteria and fungi. Thanks to new tools that have become available in biochemistry and molecular genetics, parts of the ethylene biosynthesis, perception and signal transduction reactions have been elucidated. This knowledge has been applied to enhance the quality of a number of agronomically important crops. In Biology and

Frankenberger Jr., 2012-12-06 With an ever increasing demand for more food supply agricultural scientists will have to search for new ways and technologies to promote food production In recent decades plant growth regulators PGRs have made great strides in promoting plant growth and development PGRs are organic compounds which have the ability to dramatically affect physiological plant processes when present in extremely low concentrations in the range of micro to picograms Although all higher plants have the ability to synthesize PGRs endogenously they do respond to the exogenous sources most likely due to not having the capacity to synthesize sufficient endogenous phytohormones for optimal growth and development under given climatic and environmental conditions In recent years PGRs have established their position as a new generation of agrochemicals after pesticides insecticides and herbicides Interest in the commercial use of PGRs for improving plant growth and crop yields is also increasing because of their non polluting nature The use of PGRs in the post harvest technology is well established and many new breakthroughs have recently been revealed *Plant Hormones and their Role in Plant Growth and Development* P.J.
