Wasser,2012-12-06 This volume consists of papers written by evolutionary molecular and organismal biologists geneticists ecologists behavioural ecologists morphologists mathematicians theoreticians and experimentalists in honour of Professor Eviatar Eibi Nevo on the occasion of his seventieth birthday The contributors are only

a small subset of Eibi's many friends, collaborators and students, not that one can distinguish these categories among Eibi's colleagues. His widespread influence and activity both in Israel and more generally as a leading evolutionary biologist is indicated by his many co-authors on books and papers and by his many students integrated in teaching and research. This volume presents some of the most recent dramatic results of molecular genomic and organismal evolutionary processes. It represents analyses, experiments, observations, reviews, discussions and forecasts of evolutionary theory comprising both novel methods and results, reanalyzed and reviewed data sets based on comparative experimental and theoretical studies utilizing model organisms across phylogeny including bacteria, fungi, plants, animals and humans. It elucidates the revolution in molecular biology that ushered in our understanding of the evolutionary process over time and space. The topics discussed include major problems of evolutionary theory concerning origins, phylogeny, relative importance of evolutionary forces, structure and function, adaptation and speciation in space and time in changing and stressful environments. A major emerging generalization is the nonrandomness of genome structure, highlighting the importance of natural selection as a major organizing evolutionary force, not only at the phenotypic level but most importantly at the interlinked genotypic/molecular level. The integration between the molecular and organismal levels unifies life, which is subjected to the mechanism of natural selection as a major orienting evolutionary force.
