El-Amin, 2025-01-31 Fractional Modeling of Fluid Flow and Transport Phenomena focuses on mathematical and numerical aspects of fractional order modeling in fluid flow and transport phenomena The book covers fundamental concepts advancements and practical applications including modeling developments numerical solutions and convergence analysis for both time and space fractional order models Various types of flows are explored such as single and multi phase flows in porous media involving different fluid types like Newtonian non Newtonian nanofluids and ferrofluids This book serves as a comprehensive reference on fractional order modeling of fluid flow and transport phenomena offering a single resource that is currently unavailable Fractional order modeling has gained traction in engineering and science particularly in fluid dynamics and transport phenomena However its mathematical and numerical advancements have progressed relatively slowly compared to other aspects Therefore this book emphasizes the fractional order modeling of fluid flow and transport phenomena to bridge this gap Each chapter in the book delves into a specific topic closely related to the others ensuring a cohesive and self contained structure Covers advancements in fractional order fluid flow problems Serves as a comprehensive reference on fractional order modeling of fluid flow and transport phenomena Demonstrates the topic with different aspects including modeling mathematical computational and physical commentary **Experimental and Theoretical Investigations of the Physical Processes Related to the Retention Capability of a Double Screen Element against Liquid Hydrogen in Earth's Gravity and in**

Microgravity with Respect to the Applied Stimuli André Pingel, 2022-08-04 Metal screens are commonly used as components for fluid handling in spacecraft and rocket tank designs In most cases the screens perform a passive separation of the propellant phases The separation of the liquid from the gaseous propellant phase is a special challenge Liquid gas phase separation means that the gaseous phase is allowed to enter a phase separation device while the liquid phase is blocked The technical application of this process is the depressurization in a propellant tank A certain amount of the gaseous propellant phase is vented from the tank through the gas port The liquid propellant phase remains in the tank in order to be stored for the engine However if the tank causes a liquid movement during the depressurization a part of the liquid can potentially enter the gas port In order to prevent the unwanted liquid outflow a separation of the liquid from the gas is necessary This is possible with the aid of a double screen element and has already been performed for storable liquids in Earth's gravity and microgravity as well as for cryogenic liquids in Earth's gravity At the current state of the art the separation of the liquid from the gaseous phase of the cryogenic propellant hydrogen using a double screen element has not been performed in microgravity However with regard to a possible application it is mandatory to investigate the function of the double screen element for the real propellant under relevant environmental conditions In this work a cryogenic test facility has been developed and operated successfully under Earth's gravity and microgravity conditions using the drop tower at the University of Bremen Hereby the original cryogenic propellant phases liquid and gaseous hydrogen have been used The experiments show the appearance of the physical processes which are related to the retention capability of a double screen element against liquid hydrogen Furthermore these physical processes can obviously be influenced by an unknown boundary condition at the screens the screen saturation This unknown boundary condition in turn can obviously be influenced by a certain stimulus which causes a special fluid mechanical process A simplified mathematical and two numerical models have been developed which combine the observed physical processes in the experiments Two fitting parameters are introduced which influence the flow through screen pressure loss of the liquid and the gaseous hydrogen phase After the fitting to experimental data the two fitting parameters have been interpreted with respect to a possible screen saturation The results lead to a prediction of the unknown boundary condition and indicate that a partial saturation of the screens with liquid could be present in each considered experiment This can possibly lead to a major influence of the overall resistance of the double screen element against liquid hydrogen
